

A scalable Approach to Size-independent Network Similarity

Michele Berlingerio
Tina Eliassi-Rad

Danai Koutra
Christos Faloutsos

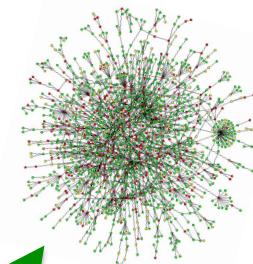

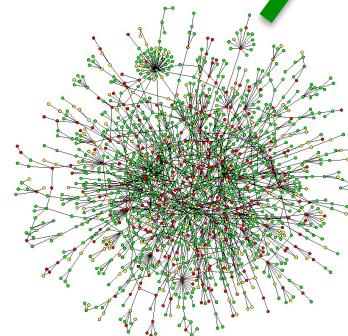

WIN, September 28th-29th 2012, NYU Stern School of Business

Why network similarity? (1)

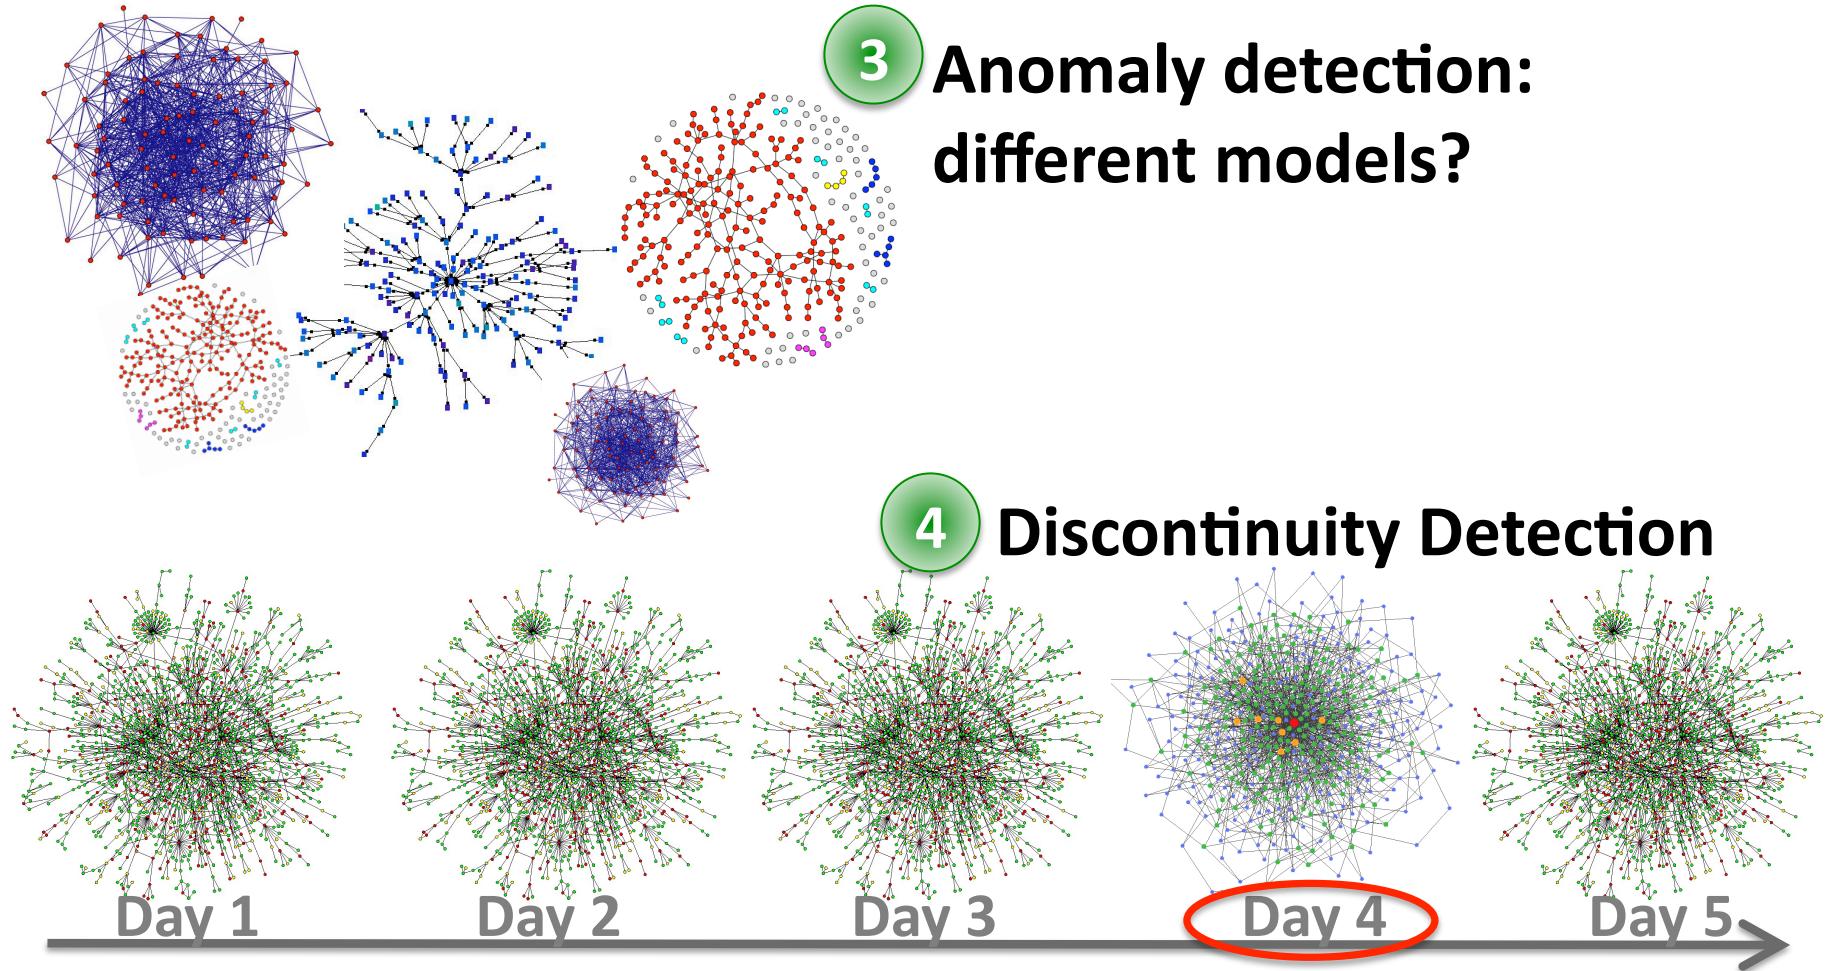

1 Graph Database: clustering

2 x-fer learning

Danai Koutra (CMU) - danai@cs.cmu.edu

Why network similarity? (2)

RoadMap

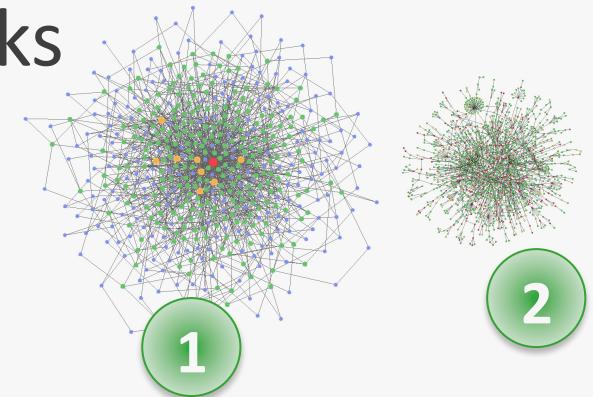

- Problem Definition
- *NetSimile*
- Experiments
 - Applications
- Conclusions

Danai Koutra (CMU) - danai@cs.cmu.edu

Network Similarity: Definition

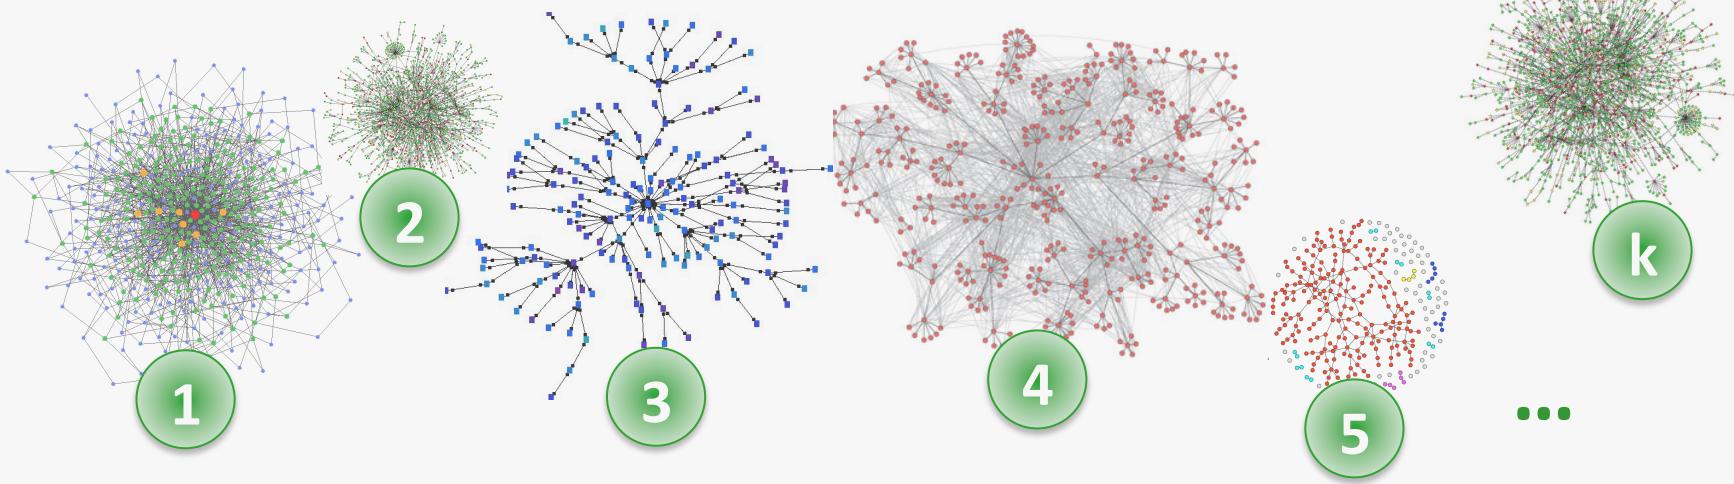

- **INPUT:** 2 anonymized networks
 - **GIVEN:** node IDs
 - **NOT GIVEN:** side-info
class labels
- **OUTPUT:** structural similarity score

Danai Koutra (CMU) - danai@cs.cmu.edu

Network Similarity: Extension

- **INPUT:** set of anonymized networks

- **OUTPUT:** pairwise structural similarity scores

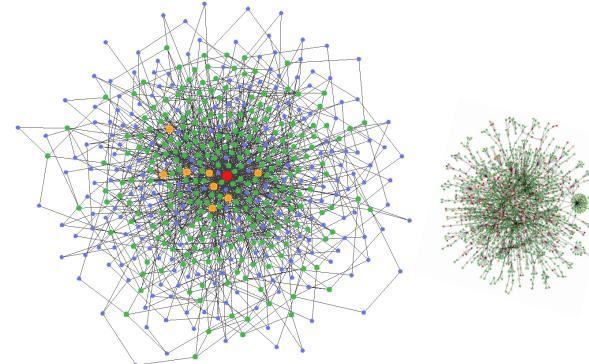

and...

$$\begin{aligned}s_{12} &= 0.8 \\ s_{13} &= 0.1 \\ \dots \\ s_{5k} &= 1\end{aligned}$$

Required Properties

- **P1. effectiveness**
 - size-independence
 - intuitiveness
 - interpretability
- **P2. scalability**

Danai Koutra (CMU) - danai@cs.cmu.edu

RoadMap

- Problem Definition
- *NetSimile*
- Experiments
 - Applications
- Conclusions

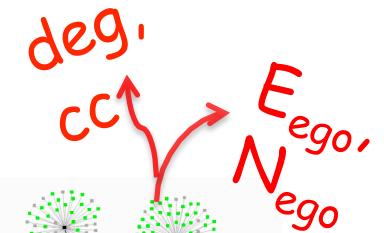

Danai Koutra (CMU) - danai@cs.cmu.edu

NetSimile: overview

1 – Feature Extraction

2 – Feature Aggregation

3 - Comparison

$$\frac{1}{n} \sum \sqrt{\mathbb{E}[X^2] - \mathbb{E}[X]^2}$$

similarity metric

Danai Koutra (CMU) - danai@cs.cmu.edu

Step 1: Feature Extraction

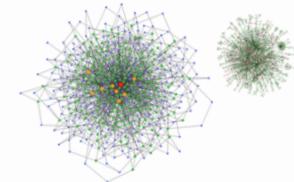

- Local
- ① # of edges in ego network
 - ② closeness centrality
 - ③ average in-degree
 - ④ average out-degree
 - ⑤ degree centrality
 - ⑥ edges in ego network
 - ⑦ # of neighbors of ego network

Why these features?

They satisfy all the constraints!

Required Properties

- effectiveness
 - size-independence
 - intuitiveness
 - interpretability
- scalability

Danai Koutra (CMU) - danai@cs.cmu.edu

Danai Koutra (CMU) - danai@cs.cmu.edu

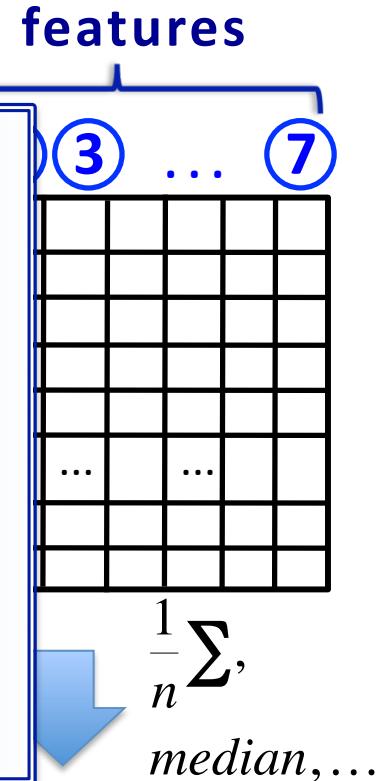

10

Step 2: Feature Aggregation

- 5 aggregators
 - median
 - mean
 - mean absolute deviation
 - standard deviation
 - skewness
 - kurtosis

Why these aggregators?

They satisfy the effectiveness + scalability constraints!

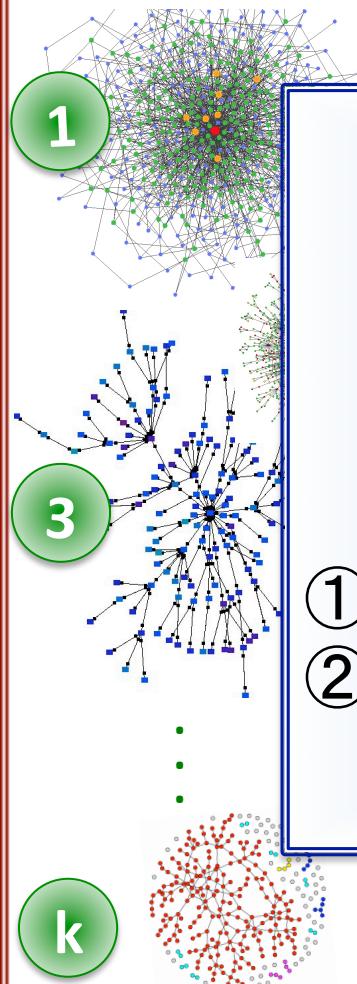

median mean s.d. skewness kurtosis

single 'signature'
vector per network

Step 3: Comparison

Networks

'Signature' Vectors
(aggr. features)

Why Canberra distance?

$$\text{canberra}(\vec{P}, \vec{Q}) = \sum_{i=1}^d \frac{|P_i - Q_i|}{|P_i| + |Q_i|}$$

- ① sensitive to small changes near 0
- ② normalizes the absolute difference of the individual comparisons.

\vec{s}_{Gk}

Kolmogorov-Smirnov

...

$s_{k-1,k}$

Required Properties: NetSimile

P1. effectiveness

- size-independence
- intuitiveness
- interpretability
- avoids the node-correspondence problem

P2. scalability

LEMMA

The runtime complexity for generating NetSimile's 'signature' vectors is linear on the number of edges in the input networks:

$$O\left(\sum_{j=1}^k f \cdot n_j + f \cdot n_j \cdot \log(n_j)\right)$$

nodes

Danai Koutra (CMU) - danai@cs.cmu.edu

RoadMap

- Problem Definition
- *NetSimile*
- **Experiments**
 - Applications
- Conclusions

Danai Koutra (CMU) - danai@cs.cmu.edu

Experiments: Data

- 30 real-world networks

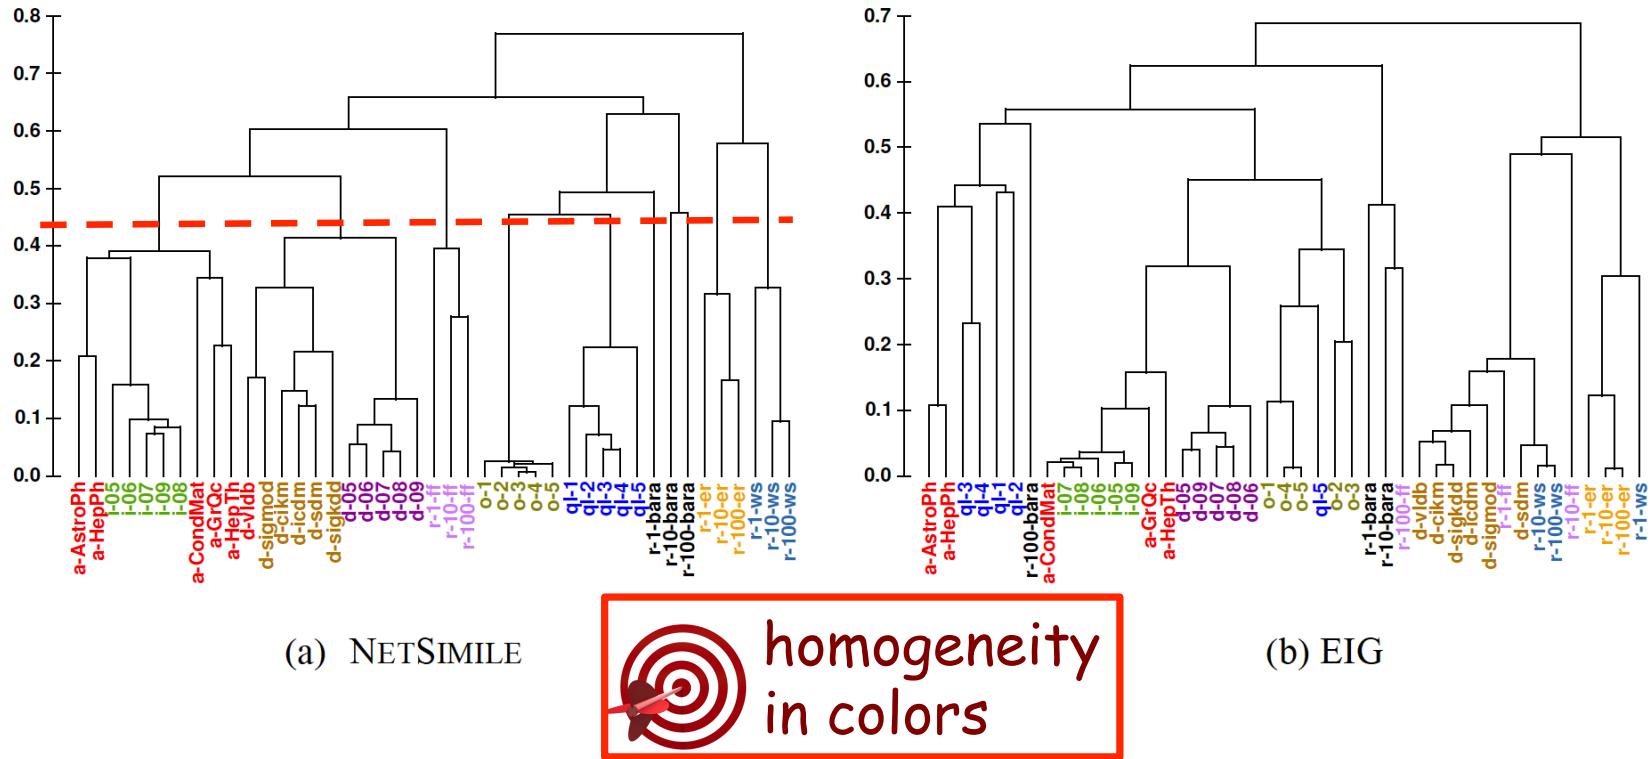

- multiple synthetic networks
 - Barabási-Albert
 - Forest Fire
 - Erdős-Rényi
 - Watts-Strogatz

Danai Koutra (CMU) - danai@cs.cmu.edu

Experiments: intuitiveness + interpretability of NetSimile

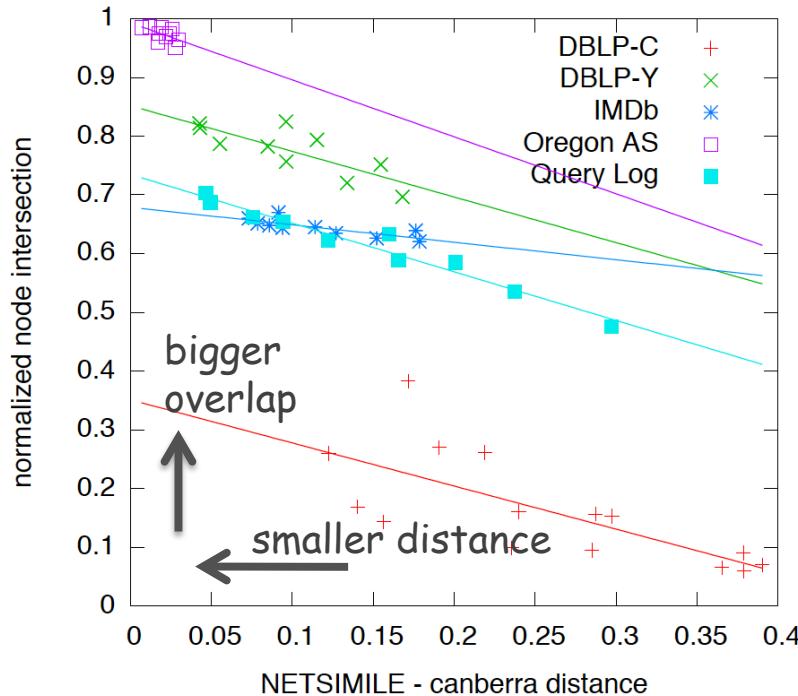

Observation:

NetSimile gives better and more intuitive graph clusters than the EIG method (eval-based competitor method).

Danai Koutra (CMU) - danai@cs.cmu.edu

Experiments: NetSimile and node-overlap

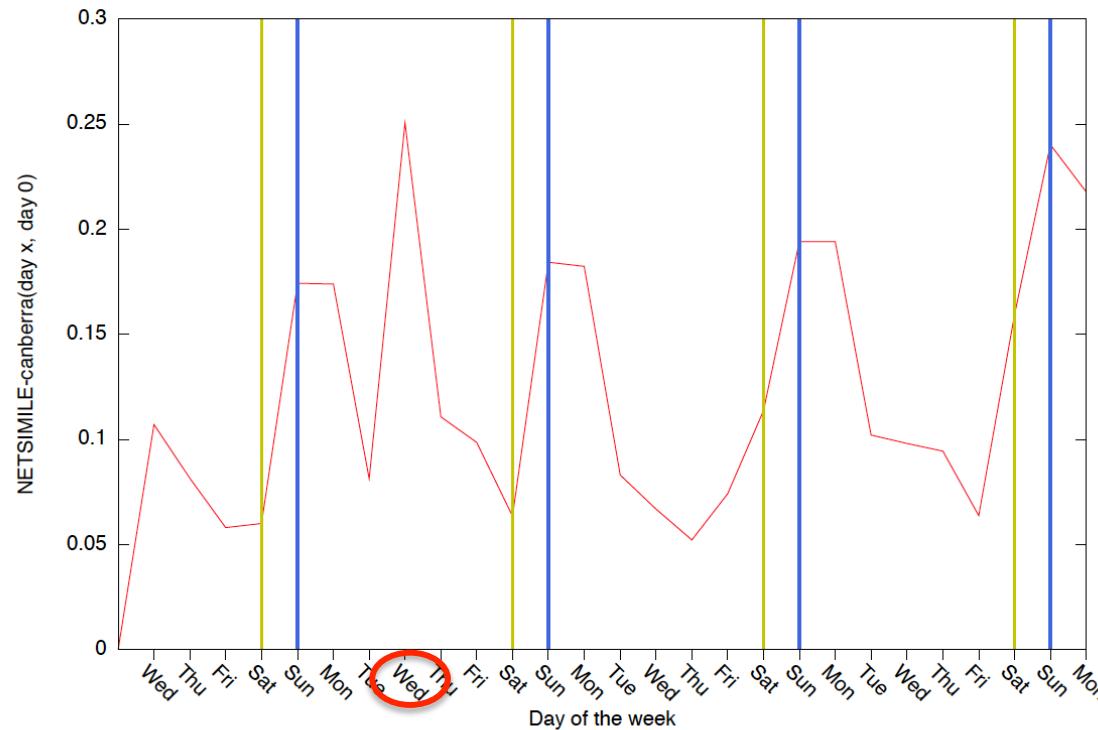

Hypothesis:
bigger node overlap =>
greater similarity

Implicit Assumption:
networks are from the
same domain

Observation:

The lower the NetSimile score (greater similarity), the higher the normalized node intersection of the input networks.

Application: Discontinuity Detection in Yahoo! IM

(a) NETSIMILE between each day and day 0 in Yahoo! IM

1. Microsoft offers to buy Yahoo!.
2. New features for flickr were announced.

nodes: IM users
edges: communication events

RoadMap

- Problem Definition
- *NetSimile*
- Experiments
 - Applications
- Conclusions

Danai Koutra (CMU) - danai@cs.cmu.edu

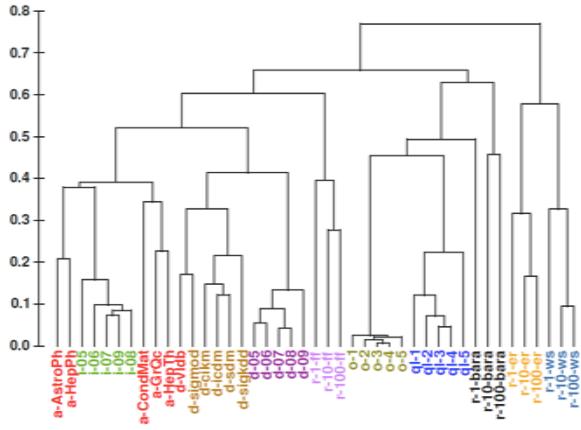

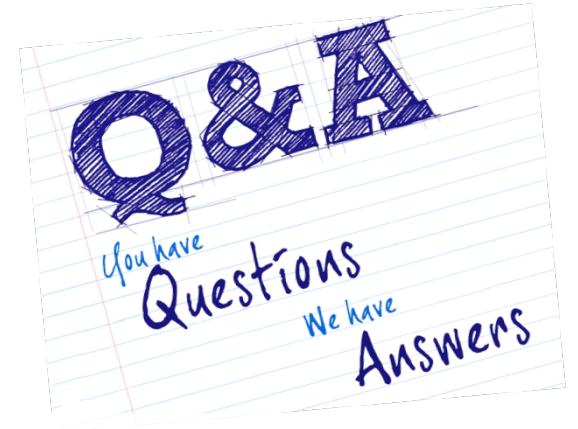

Conclusions

- **Novel approach:**
 - ‘signature’ vector for each graph (summarization)
- **NetSimile:**
 - effective
 - size-independent, intuitive, interpretable
 - scalable
- **Applicability** to a variety of problems

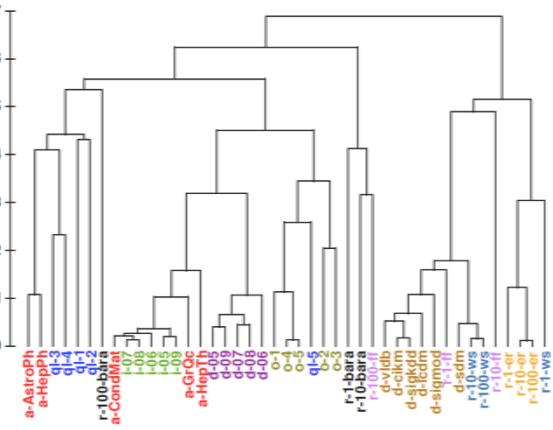

Danai Koutra (CMU) - danai@cs.cmu.edu

Thank you!

(a) NETSIMILE

(b) EIG

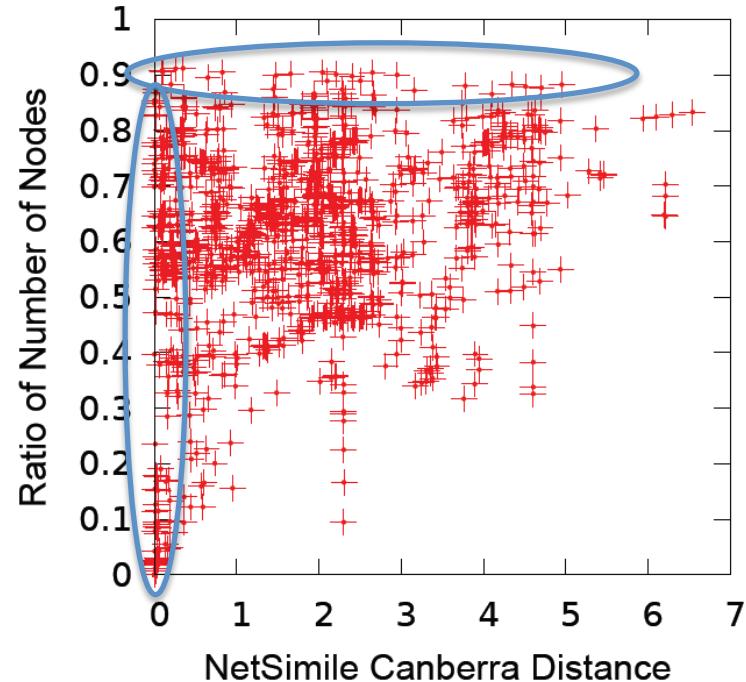

<http://www.cs.cmu.edu/~dkoutra>

danai@cs.cmu.edu

Danai Koutra (CMU) - danai@cs.cmu.edu

Experiments (2): Are we measuring size?

Observation:

NetSimile is **not** measuring size – there is no correlation between extracted features and network size.

Advantages of NetSimile

- size-invariant
- scalable

LEMMA

The runtime complexity for generating NetSimile's 'signature' vectors is linear on the number of edges in the input networks:

$$O\left(\sum_{j=1}^k f \cdot n_j + f \cdot n_j \cdot \log(n_j)\right)$$

↗ # nodes

- avoids the node-correspondence problem

Danai Koutra (CMU) - danai@cs.cmu.edu
