

Homework #1

Due Date: Sept. 21, 2004

1. Consider the following systems, where $g(x,y) = S\{f(x,y)\}$:
 - I. $S\{f(x,y)\} = f(ax, ay)$
 - II. $S\{f(x,y)\} = f(x-a, y-b)$
 - III. $S\{f(x,y)\} = \text{sqrt}(f(x,y))$
 - IV. $S\{f(x,y)\} = \frac{1}{2}(f(x-a, y-b) + f(x+a, y+b))$
 where a, b are non-zero, real numbers. For each answer the following
 - a. Is this system linear?
 - b. Is this system space invariant?
 - c. If the system is linear, determine the system impulse response.
 - d. If the system is linear and space invariant, determine the Fourier transform of g in terms of the Fourier transform of f .

2. Let a, b be non-zero, real numbers. Find the 2D Fourier transforms of:
 - a. $\text{rect}(ax-b)$
 - b. $\text{rect}(x-a)\text{sinc}(by)$
 - c. $\text{circ}(r)\delta(x)$
 - d. $\delta(r - r_0)$
 - e. $\text{rect}(r-a/b)$, where $a > b$.
 - f. $g_r(ar)$ [Let $F\{g_r(r)\} = G(\rho)$.]
 - g. $\exp(-\pi(r/a)^2)$

3. A pinhole imaging system as shown below uses a circular pinhole of radius R . Using the geometry shown and assuming a constant collector efficiency (e.g. the pinhole is equally sensitive to all points on the image), find the output spatial frequency spectrum $I_2(u,v)$ in terms of the input spectrum, $I_1(u,v)$.

5. Derive (using either the definitions of the 2D delta function or properties of 1D delta functions) the following relationships:

a. $f(x,y)\delta(x-a,y-b) = f(a,b)\delta(x-a,y-b)$

b. $f(x,y)**\delta(x-a,y-b) = f(x-a,y-b)$

c. $\delta(ax,by) = \delta(x,y)/|ab|$

6. Consider a charge coupled (CCD) imaging device that is used to sample image $g(x,y)$.

Assume that its FT $G(u,v)$ has no energy for spatial frequencies $\sqrt{u^2 + v^2} \geq s_c$ and that the spacing of the collectors on the CCD is $\frac{1}{2s_c}$ in both the x and y directions. Also, assume that

each collector is a square of size a by a , where $a < \frac{1}{2s_c}$. Finally, assume that all photons

incident upon the collector are included in the sampled signal – that is, the sampled signal can be represented by the integration of the incident intensity over a square of size a by a .

a. Show that sampled signal can be represented as:

$$g_s(x,y) = [g(x,y)**c(x,y)]s(x,y)$$

where $c(x,y)$ is the a by a collector function and $s(x,y)$ is an ideal sampling function.

b. Specify a filter $H(u,v)$ that operates on the sampled spectrum $G_s(u,v)$, which will restore the original image
