Appendix E – JMBS Quick Reference .....	E1
Appendix G –Index of Source Code .....	G1

## Appendix A -- Java Quick Reference

**class java.lang.Object** // all classes inherit and may override these methods

- boolean equals(Object other)
- String toString()

**interface java.lang.Comparable**

- int compareTo(Object other) // return value < 0 if this is less than other  
// return value = 0 if this is equal to other  
// return value > 0 if this is greater than other

**class java.lang.Integer implements java.lang.Comparable**

- Integer(int value) // constructor
- int intValue()

**class java.lang.Double implements java.lang.Comparable**

- Double(double value) // constructor
- double doubleValue()

**class java.lang.String implements java.lang.Comparable**

- int length()
- String substring(int from, int to) // returns the substring beginning at from  
// and ending at to-1
- String substring(int from) // returns substring(from, length())
- int indexOf(String s) // returns the index of the first occurrence of s;  
// returns -1 if not found

**class java.lang.Math**

- static int abs(int x)
- static double abs(double x)
- static double pow(double base, double exponent)
- static double sqrt(double x)

**class java.util.Random**

- int nextInt(int n) // returns an integer in the range from 0 to n-1 inclusive
- double nextDouble() // returns a double in the range [0.0, 1.0)

**class java.util.ArrayList**

- int size()
- boolean add(Object x) // appends x to end of list; returns true
- Object get(int index)
- Object set(int index, Object x) // replaces the element at index with x  
// returns the element formerly at the specified position
- void add(int index, Object x) // inserts x at position index, sliding elements  
// at position index and higher to the right  
// (adds 1 to their indices) and adjusts size
- Object remove(int index) // removes element from position index, sliding elements  
// at position index + 1 and higher to the left  
// (subtracts 1 from their indices) and adjusts size

## Appendix B -- Source Code for Visible Classes

This appendix contains implementations of the visible core classes covered in Chapters 1 - 4: Simulation, Fish, DarterFish, and SlowFish. Information about the Environment interface can be found in Appendix C.

### Simulation.java

```

/**
 * Marine Biology Simulation:
 * A Simulation object controls a simulation of fish
 * movement in an Environment.
 *
 * @version 1 July 2002
 **/

public class Simulation
{
    // Instance Variables: Encapsulated data for each simulation object
    private Environment theEnv;
    private EnvDisplay theDisplay;

    /** Constructs a Simulation object for a particular environment.
     * @param env the environment on which the simulation will run
     * @param display an object that knows how to display the environment
     **/
    public Simulation(Environment env, EnvDisplay display)
    {
        theEnv = env;
        theDisplay = display;

        // Display the initial state of the simulation.
        theDisplay.showEnv();
        Debug.println("----- Initial Configuration -----");
        Debug.println(theEnv.toString());
        Debug.println("-----");
    }

    /** Runs through a single step of this simulation. **/
    public void step()
    {
        // Get all the fish in the environment and ask each
        // one to perform the actions it does in a timestep.
        Locatable[] theFishes = theEnv.allObjects();
        for ( int index = 0; index < theFishes.length; index++ )
        {
            ((Fish)theFishes[index]).act();
        }

        // Display the state of the simulation after this timestep.
        theDisplay.showEnv();
        Debug.println(theEnv.toString());
        Debug.println("----- End of Timestep -----");
    }
}

```

**Fish.java (includes breeding and dying modifications from Chapter 3)**

```

import java.awt.Color;
import java.util.ArrayList;
import java.util.Random;

/**
 * Marine Biology Simulation:
 * A Fish object represents a fish in the Marine Biology
 * Simulation. Each fish has a unique ID, which remains constant
 * throughout its life. A fish also maintains information about its
 * location and direction in the environment.
 *
 * Modification History:
 * - Modified to support a dynamic population in the environment:
 *   fish can now breed and die.
 *
 * @version 1 July 2002
 */

public class Fish implements Locatable

## Appendix C -- Black Box Classes

This appendix contains summary class documentation for the `Environment` interface and the MBS utility classes covered in Chapters 1 - 4 (`Debug`, `Direction`, `EnvDisplay`, `Locatable`, `Location`, and `RandNumGenerator`).

### Environment interface

```
public int numRows()
    Returns number of rows in this environment.

public int numCols()
    Returns number of columns in this environment.

public boolean isValid(Location loc)
    Returns true if loc is valid in this environment; otherwise returns false.

public int numCellSides()
    Returns the number of sides around each cell.

public int numAdjacentNeighbors()
    Returns the number of adjacent neighbors around each cell.

public Direction randomDirection()
    Generates a random direction. The direction returned by randomDirection reflects the direction from a cell
    in the environment to one of its adjacent neighbors.

public Direction getDirection(Location fromLoc, Location toLoc)
    Returns the direction from one location to another.

public Location getNeighbor(Location fromLoc, Direction compassDir)
    Returns the adjacent neighboring location of a location in the specified direction (whether valid or invalid).

public java.util.ArrayList neighborsOf(Location ofLoc)
    Returns the adjacent neighboring locations of a specified location. Only neighbors that are valid locations in the
    environment will be included.

public int numObjects()
    Returns the number of objects in this environment.

public Locatable[] allObjects()
    Returns all the objects in this environment.

public boolean isEmpty(Location loc)
    Returns true if loc is a valid location in the context of this environment and is empty; false otherwise.

public Locatable objectAt(Location loc)
    Returns the object at location loc; null if loc is not in the environment or is empty.

public void add(Locatable obj)
    Adds a new object to this environment at the location it specifies.
    (Precondition: obj.location() is a valid empty location.)
```

```
public void remove(Locatable obj)
    Removes the object from this environment.
    (Precondition: obj is in this environment.)
```

```
public void recordMove(Locatable obj, Location oldLoc)
    Updates this environment to reflect the fact that an object moved.
    (Precondition: obj.location() is a valid location and there is no other object there.
    Postcondition: obj is at the appropriate location (obj.location()), and either oldLoc is equal to
    obj.location() (there was no movement) or oldLoc is empty.)
```

## Debug class

```
public static boolean isOn()
    Checks whether debugging is on (not necessary when using Debug.print and Debug.println).
```

```
public static boolean isOff()
    Checks whether debugging is off (not necessary when using Debug.print and Debug.println).
```

```
public static void turnOn()
    Turns debugging on.
```

```
public static void turnOff()
    Turns debugging off.
```

```
public static void restoreState()
    Restores the previous debugging state. If there is no previous state to restore, restoreState turns debugging
    off.
```

```
public static void print(String message)
    Prints debugging message without appending a newline character at the end. If debugging is turned on, message
    is printed to System.out without a newline.
```

```
public static void println(String message)
    Prints debugging message, appending a newline character at the end. If debugging is turned on, message is
    printed to System.out followed by a newline.
```

## Direction class

Public class constants: NORTH, NORTHEAST, EAST, SOUTHEAST, SOUTH, SOUTHWEST, WEST, NORTHWEST

Note: these are class constants of type `Direction` (e.g., `Direction.NORTH`) that represent compass directions in degrees (0°, 45°, 90°, 135°, 180°, 225°, 270°, 315°, respectively)

```
public Direction()
```

Constructs a default `Direction` object facing North.

```
public Direction(int degrees)
```

Constructs a `Direction` object - initial compass direction in degrees.

```
public Direction(String str)
```

Constructs a `Direction` object - compass direction specified as a string, e.g. "North".

```
public int inDegrees()
```

Returns this direction value in degrees.

```
public boolean equals(Object other)
```

Returns true if `other` has the same number of degrees as this direction; false otherwise.

```
public Direction toRight()
```

Returns the direction that is a quarter turn to the right of this `Direction` object.

```
public Direction toRight(int deg)
```

Returns the direction that is `deg` degrees to the right of this `Direction` object.

```
public Direction toLeft()
```

Returns the direction that is a quarter turn to the left of this `Direction` object.

```
public Direction toLeft(int deg)
```

Returns the direction that is `deg` degrees to the left of this `Direction` object.

```
public Direction reverse()
```

Returns the direction that is the reverse of this `Direction` object.

```
public String toString()
```

Returns a string indicating the direction.

```
public static Direction randomDirection()
```

Returns a random direction in the range of [0, 360) degrees.

## EnvDisplay interface

```
public void showEnv()  
    Shows the current state of the environment.
```

## Locatable interface

```
public Location location()  
    Returns the location of this object.
```

## Location class (implements Comparable)

```
public Location(int row, int col)  
    Constructs a Location object.
```

```
public int row()  
    Returns the row coordinate of this location.
```

```
public int col()  
    Returns the column coordinate of this location.
```

```
public boolean equals(Object other)  
    Returns true if other is at the same row and column as the current location; false otherwise.
```

```
public int compareTo(Object other)  
    Compares this location to other for ordering. Returns a negative integer, zero, or a positive integer as this location is less than, equal to, or greater than other. Locations are ordered in row-major order.  
(Precondition: other is a Location object.)
```

```
public String toString()  
    Returns a string indicating the row and column of the location in (row, col) format.
```

## RandNumGenerator class

```
public static java.util.Random getInstance()  
    Returns a random number generator. Always returns the same Random object to provide a better sequence of random numbers.
```

## Appendix E -- JMBS Quick Reference

### *Quick Reference for Core Classes and Interfaces*

#### Simulation Class

```
public Simulation(Environment env, EnvDisplay display)
public void step()
```

#### Environment Interface

```
public int numRows()
public int numCols()

public boolean isValid(Location loc)
public int numCellSides()
public int numAdjacentNeighbors()
public Direction randomDirection()
public Direction getDirection(Location fromLoc, Location toLoc)
public Location getNeighbor(Location fromLoc, Direction compassDir)
public ArrayList neighborsOf(Location ofLoc)

public int numObjects()
public Locatable[] allObjects()
public boolean isEmpty(Location loc)
public Locatable objectAt(Location loc)

public void add(Locatable obj)
public void remove(Locatable obj)
public void recordMove(Locatable obj, Location oldLoc)
```

## *Quick Reference for Fish Class*

### Fish Class (implements Locatable)

```

public Fish(Environment env, Location loc)
public Fish(Environment env, Location loc, Direction dir)
public Fish(Environment env, Location loc, Direction dir, Color col)
private void initialize(Environment env, Location loc, Direction dir,
                        Color col)
protected Color randomColor()

public int id()
public Environment environment()
public Color color()
public Location location()
public Direction direction()
public boolean isInEnv()
public String toString()

public void act()

protected boolean breed()
protected void generateChild(Location loc)
protected void move()
protected Location nextLocation()
protected ArrayList emptyNeighbors()
protected void changeLocation(Location newLoc)
protected void changeDirection(Direction newDir)
protected void die()

```

## *Quick Reference for Specialized Fish Subclasses*

### DarterFish Class (extends Fish)

```

public DarterFish(Environment env, Location loc)
public DarterFish(Environment env, Location loc, Direction dir)
public DarterFish(Environment env, Location loc, Direction dir, Color col)

protected void generateChild(Location loc)
protected void move()
protected Location nextLocation()

```

### SlowFish Class (extends Fish)

```

public SlowFish(Environment env, Location loc)
public SlowFish(Environment env, Location loc, Direction dir)
public SlowFish(Environment env, Location loc, Direction dir, Color col)

protected void generateChild(Location loc)
protected Location nextLocation()

```

## ***Quick Reference for Utility Classes and Interfaces (public constants, constructors, and methods only)***

### Case Study Utility Classes and Interfaces

#### Debug Class

```
static boolean isOn()
static boolean isOff()
static void turnOn()
static void turnOff()
static void restoreState()
static void print(String message)
static void println(String message)
```

#### EnvDisplay Interface

```
void showEnv()
```

#### Locatable Interface

```
Location location()
```

#### Direction Class

**NORTH, EAST, SOUTH, WEST, NORTHEAST,  
NORTHWEST, SOUTHEAST, SOUTHWEST**

```
Direction()
Direction(int degrees)
Direction(String str)
int inDegrees()
boolean equals(Object other)
Direction toRight()
Direction toRight(int degrees)
Direction toLeft()
Direction toLeft(int degrees)
Direction reverse()
String toString()
static Direction randomDirection()
```

#### Location Class

**(implements Comparable)**

```
Location(int row, int col)
int row()
int col()
boolean equals(Object other)
int compareTo(Object other)
String toString()
```

#### RandNumGenerator Class

```
static Random getInstance()
```

## Java Library Utility Classes

### java.util.ArrayList Class(Partial)

```
boolean add(Object obj)
void add(int index, Object objj)
Object get(int index)
Object remove(int index)
boolean remove(Object obj)
Object set(int index, Object obj)
int size()
```

### java.awt.Color Class(Partial)

```
black, blue, cyan, gray, green,  
magenta, orange, pink, red,  
white, yellow
```

```
Color(int r, int g, int b)
```

### java.util.Random Class(Partial)

```
int nextInt(int n)
double nextDouble()
```

## Appendix G -- Index for Source Code

This appendix provides an index for the Java source code found in Appendix B. Methods are grouped in alternating gray and white blocks based on the page on which they are listed.

### Simulation.java

<b>Simulation</b> (Environment env, EnvDisplay display)	B1
<b>step</b> ()	B1

### Fish.java

<b>Fish</b> (Environment env, Location loc)	B2
<b>Fish</b> (Environment env, Location loc, Direction dir)	B3
<b>Fish</b> (Environment env, Location loc, Direction dir, Color col)	B3
<b>initialize</b> (Environment env, Location loc, Direction dir, Color col)	B3
<b>randomColor</b> ()	B4
<b>id</b> ()	B4
<b>environment</b> ()	B4
<b>color</b> ()	B4
<b>location</b> ()	B4
<b>direction</b> ()	B4
<b>isInEnv</b> ()	B5
<b>toString</b> ()	B5
<b>act</b> ()	B5
<b>breed</b> ()	B6
<b>generateChild</b> (Location loc)	B6
<b>move</b> ()	B7
<b>nextLocation</b> ()	B7
<b>emptyNeighbors</b> ()	B8
<b>changeLocation</b> (Location newLoc)	B8
<b>changeDirection</b> (Direction newDir)	B8
<b>die</b> ()	B8

### DarterFish.java

<b>DarterFish</b> (Environment env, Location loc)	B9
<b>DarterFish</b> (Environment env, Location loc, Direction dir)	B9
<b>DarterFish</b> (Environment env, Location loc, Direction dir, Color col)	B10
<b>generateChild</b> (Location loc)	B10
<b>move</b> ()	B10
<b>nextLocation</b> ()	B11

## SlowFish.java

<code>SlowFish(Environment env, Location loc)</code>	B12
<code>SlowFish(Environment env, Location loc, Direction dir)</code>	B13
<code>SlowFish(Environment env, Location loc, Direction dir, Color col)</code>	B13
<code>generateChild(Location loc)</code>	B13
<code>nextLocation()</code>	B14
