

## 1. Motivation

### Architectures are moving toward Heterogeneous Computing

- Future NoCs need to support wide range of complex IPs
- Interconnect designs need to be robust and flexible

### Two tools for exploring complex NoCs

**PacketGenie:**  
Traffic Generator for interconnects of Heterogeneous Systems

**NoCVision:**  
Traffic Visualizer for Network-on-Chip Systems

## 2. PacketGenie

### PacketGenie Purpose:

- Allow **quick design-space exploration** of heterogeneous NoC interconnect
- Extract application behavior and generate traffic based on system model

### PacketGenie Goals:

- **Quick, light-weight simulation** of NoC traffic behavior
- **Highly flexible and configurable** to accommodate heterogeneous architectures
- **Easy to integrate** with existing network simulators

## 3. NoCVision

### Debugging complex NoCs: Issues

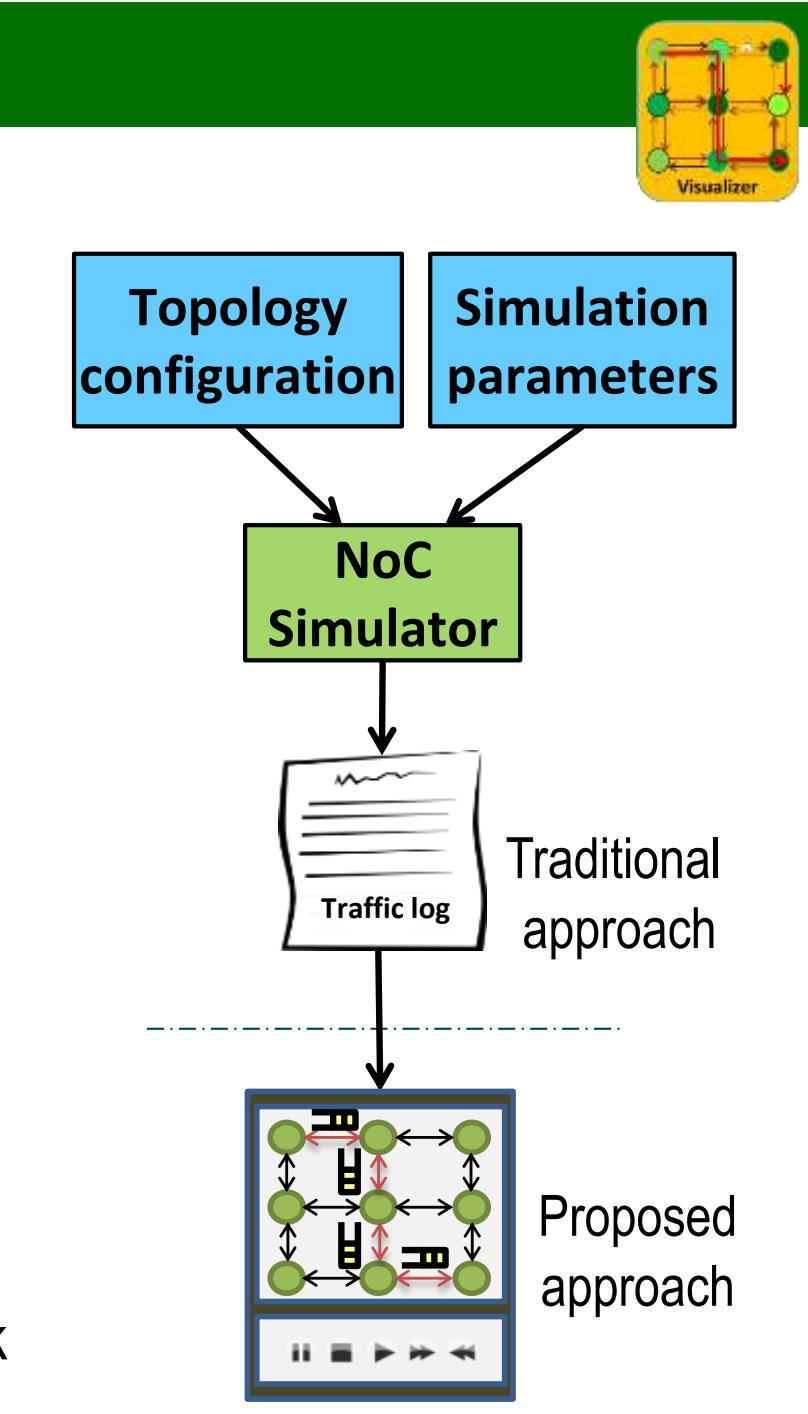

- Analyze millions of cycles
- Debug large logs

### Proposed debug approach

- Graphical representation of traffic flow
- Extraction of relevant traffic details e.g. network congestion, bottlenecks etc.

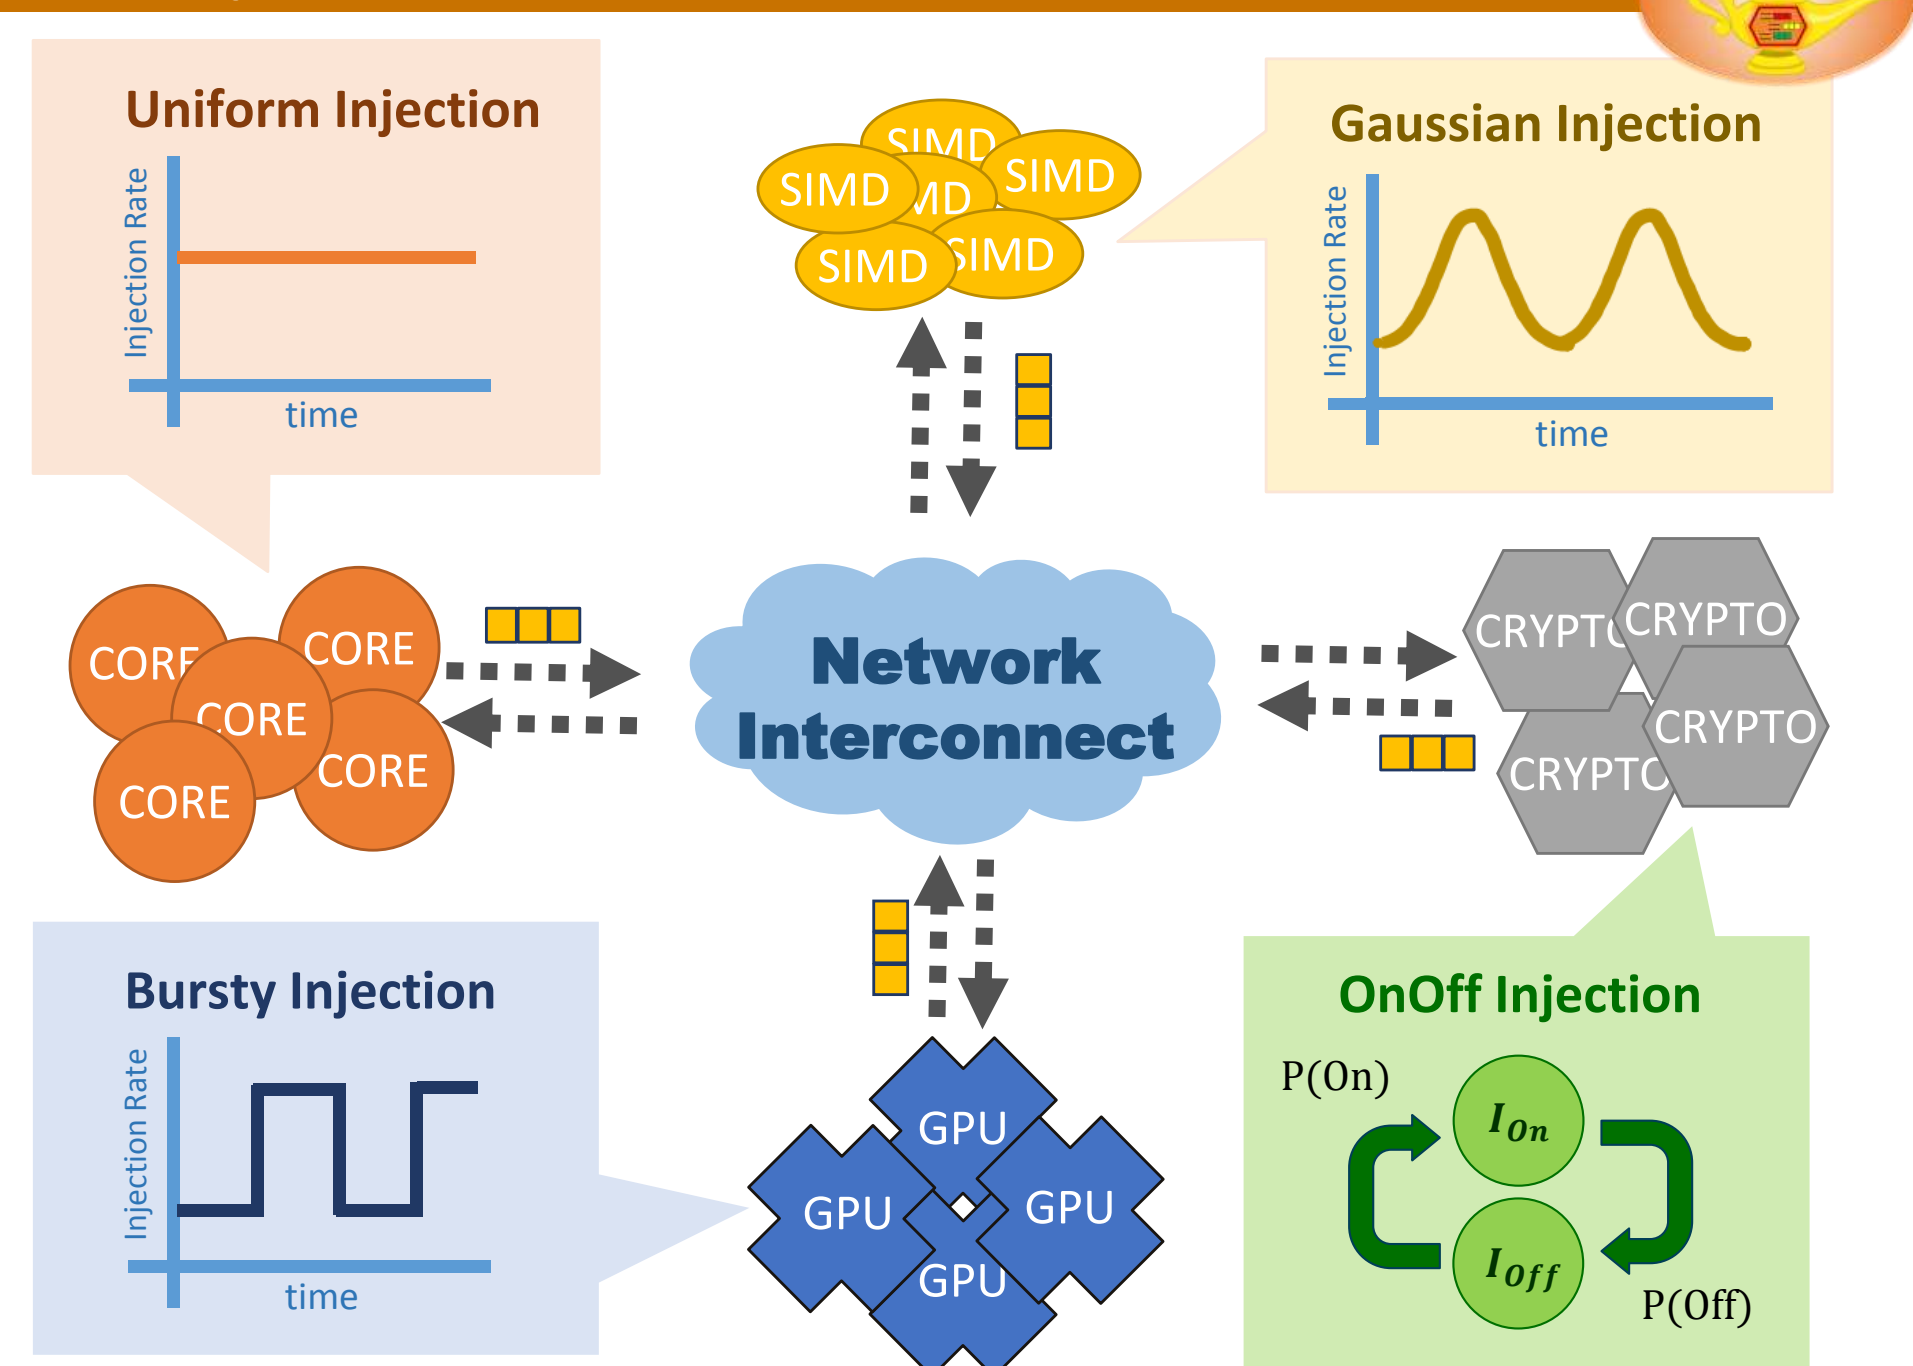

### Implementation

- Capturing interval-based and event-based packet flow
- Visualization of a network topology: router, link or VC level information

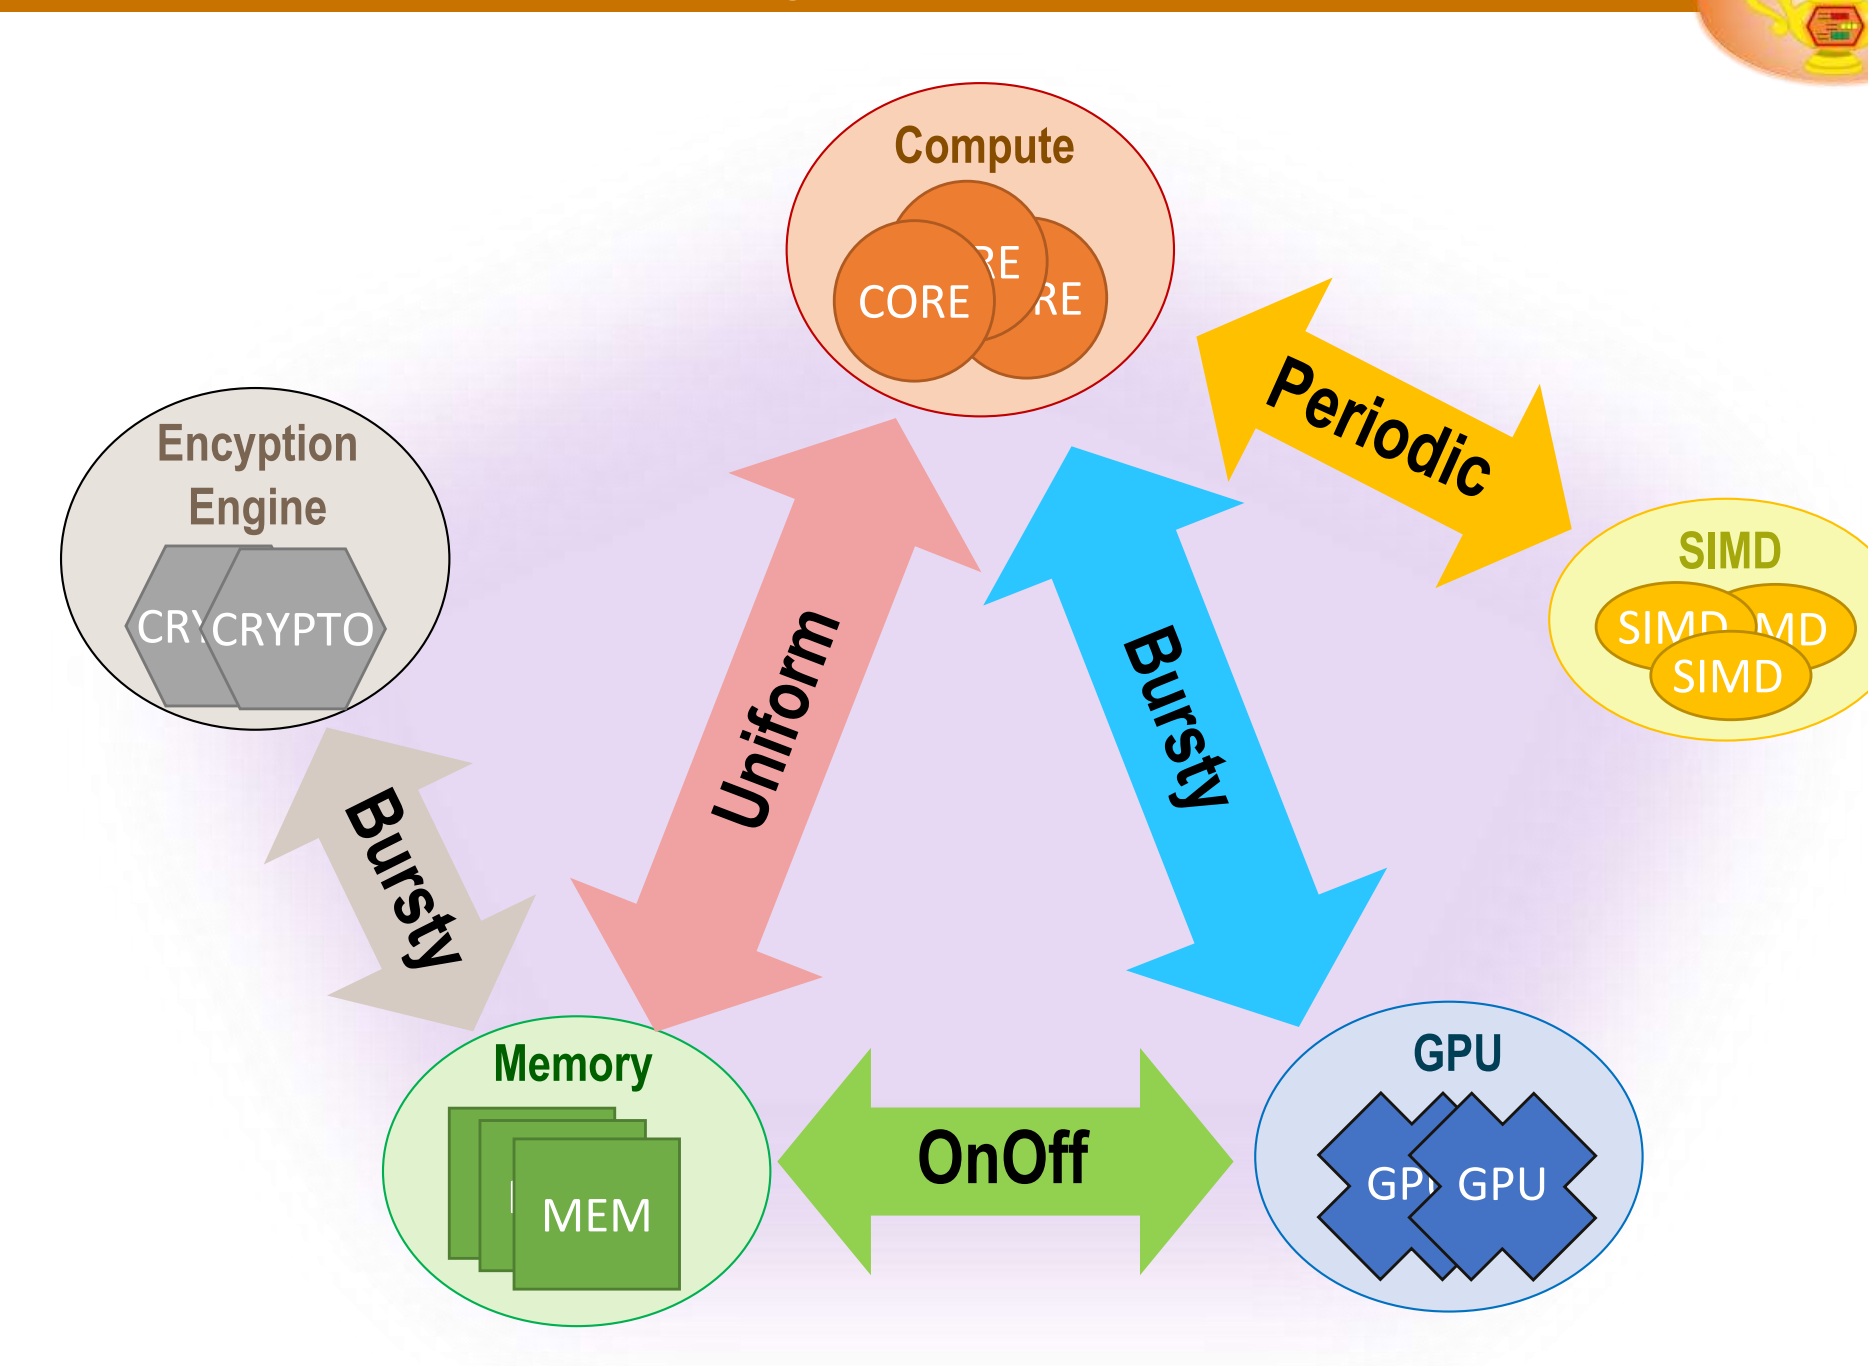

PacketGenie

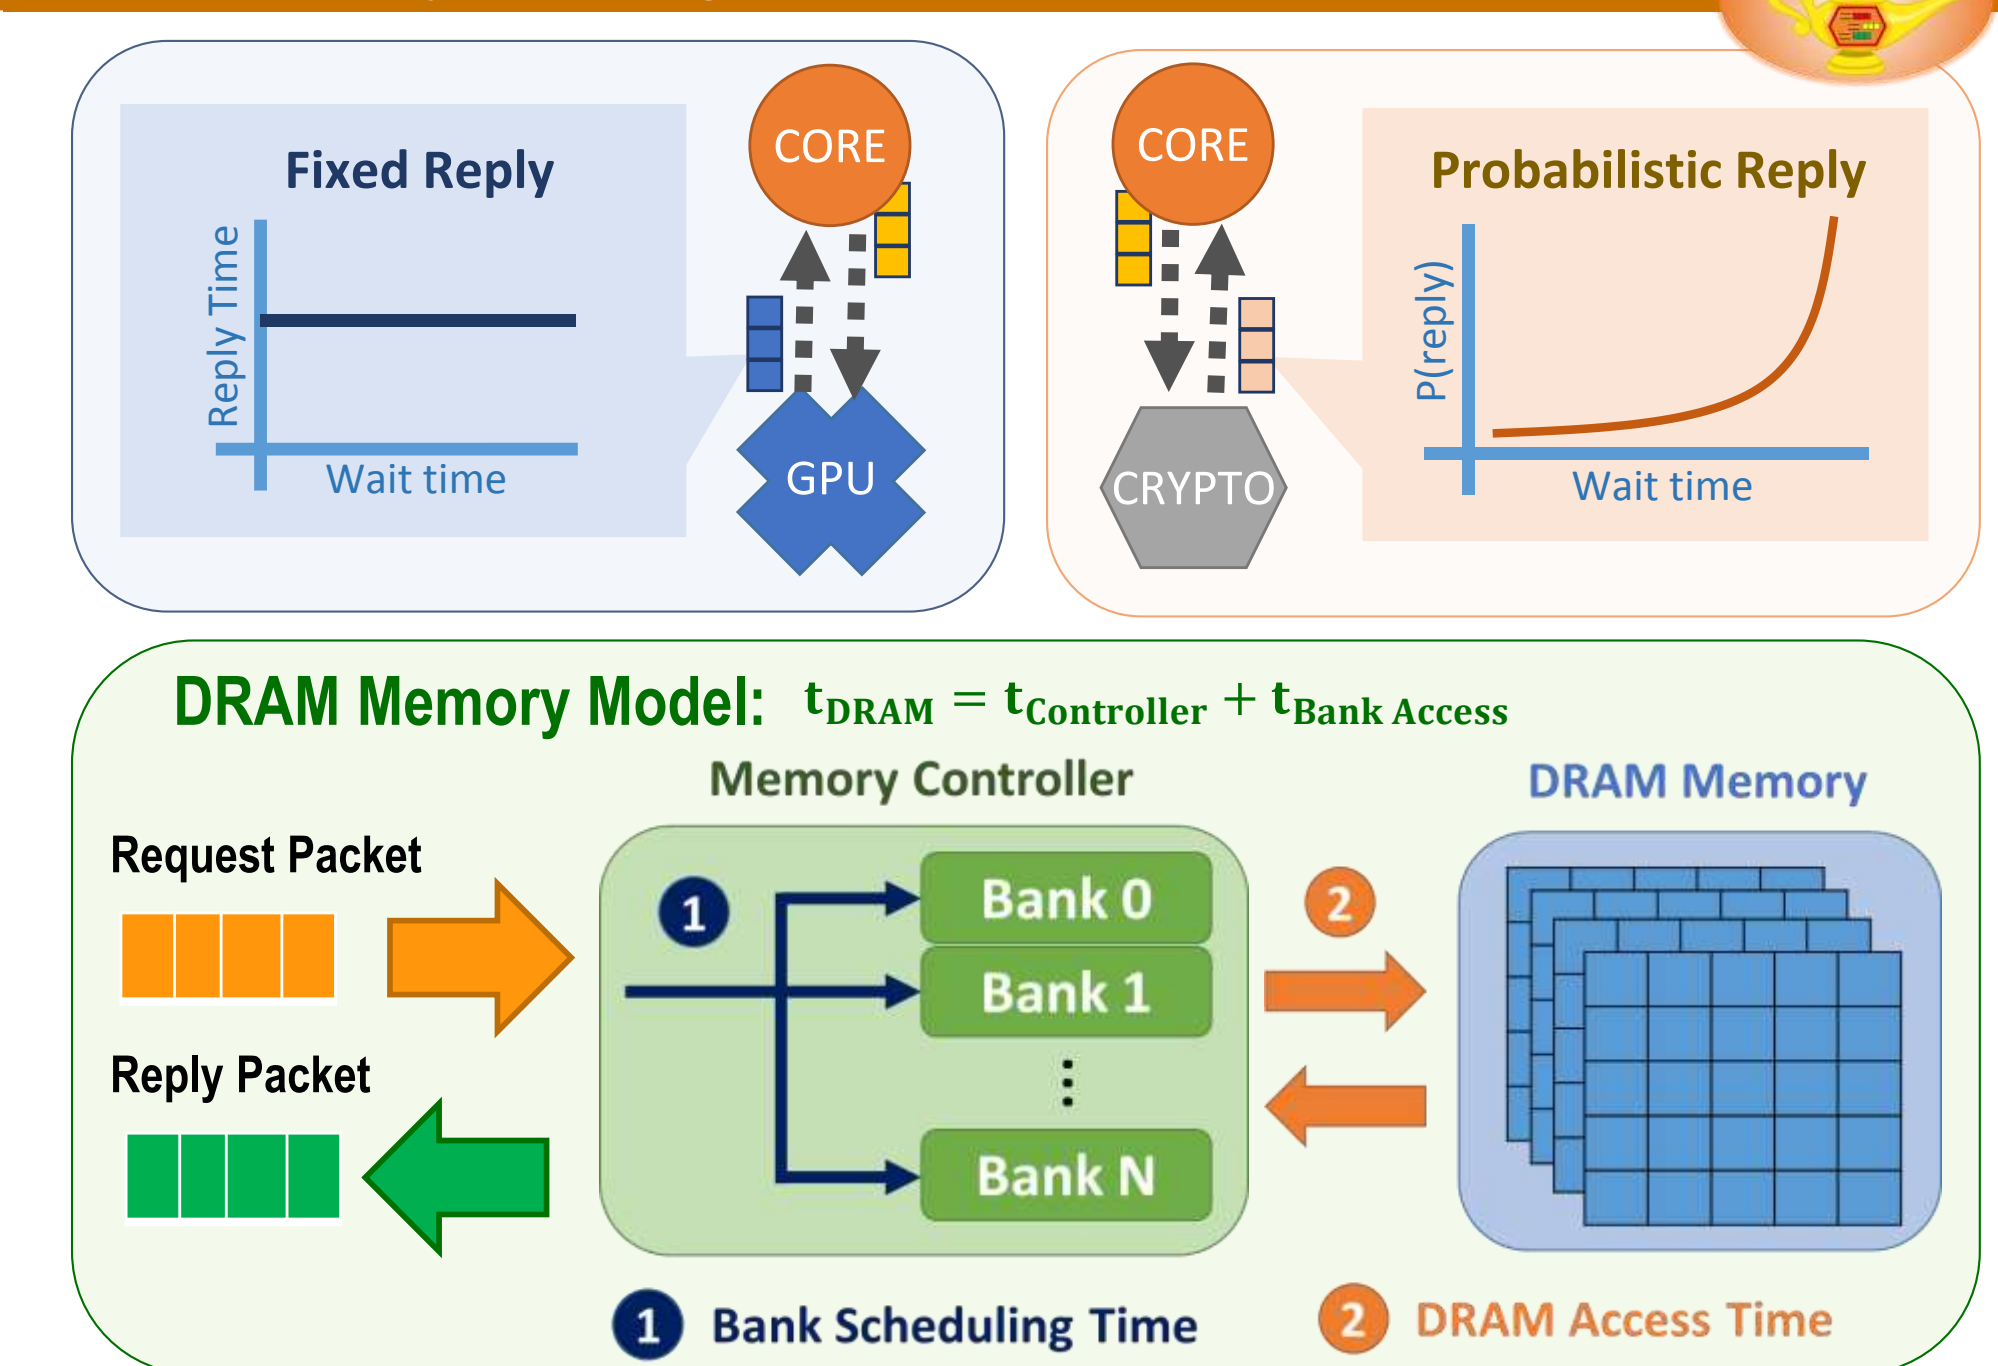

## 4. Injection Models

## 5. Example Configuration

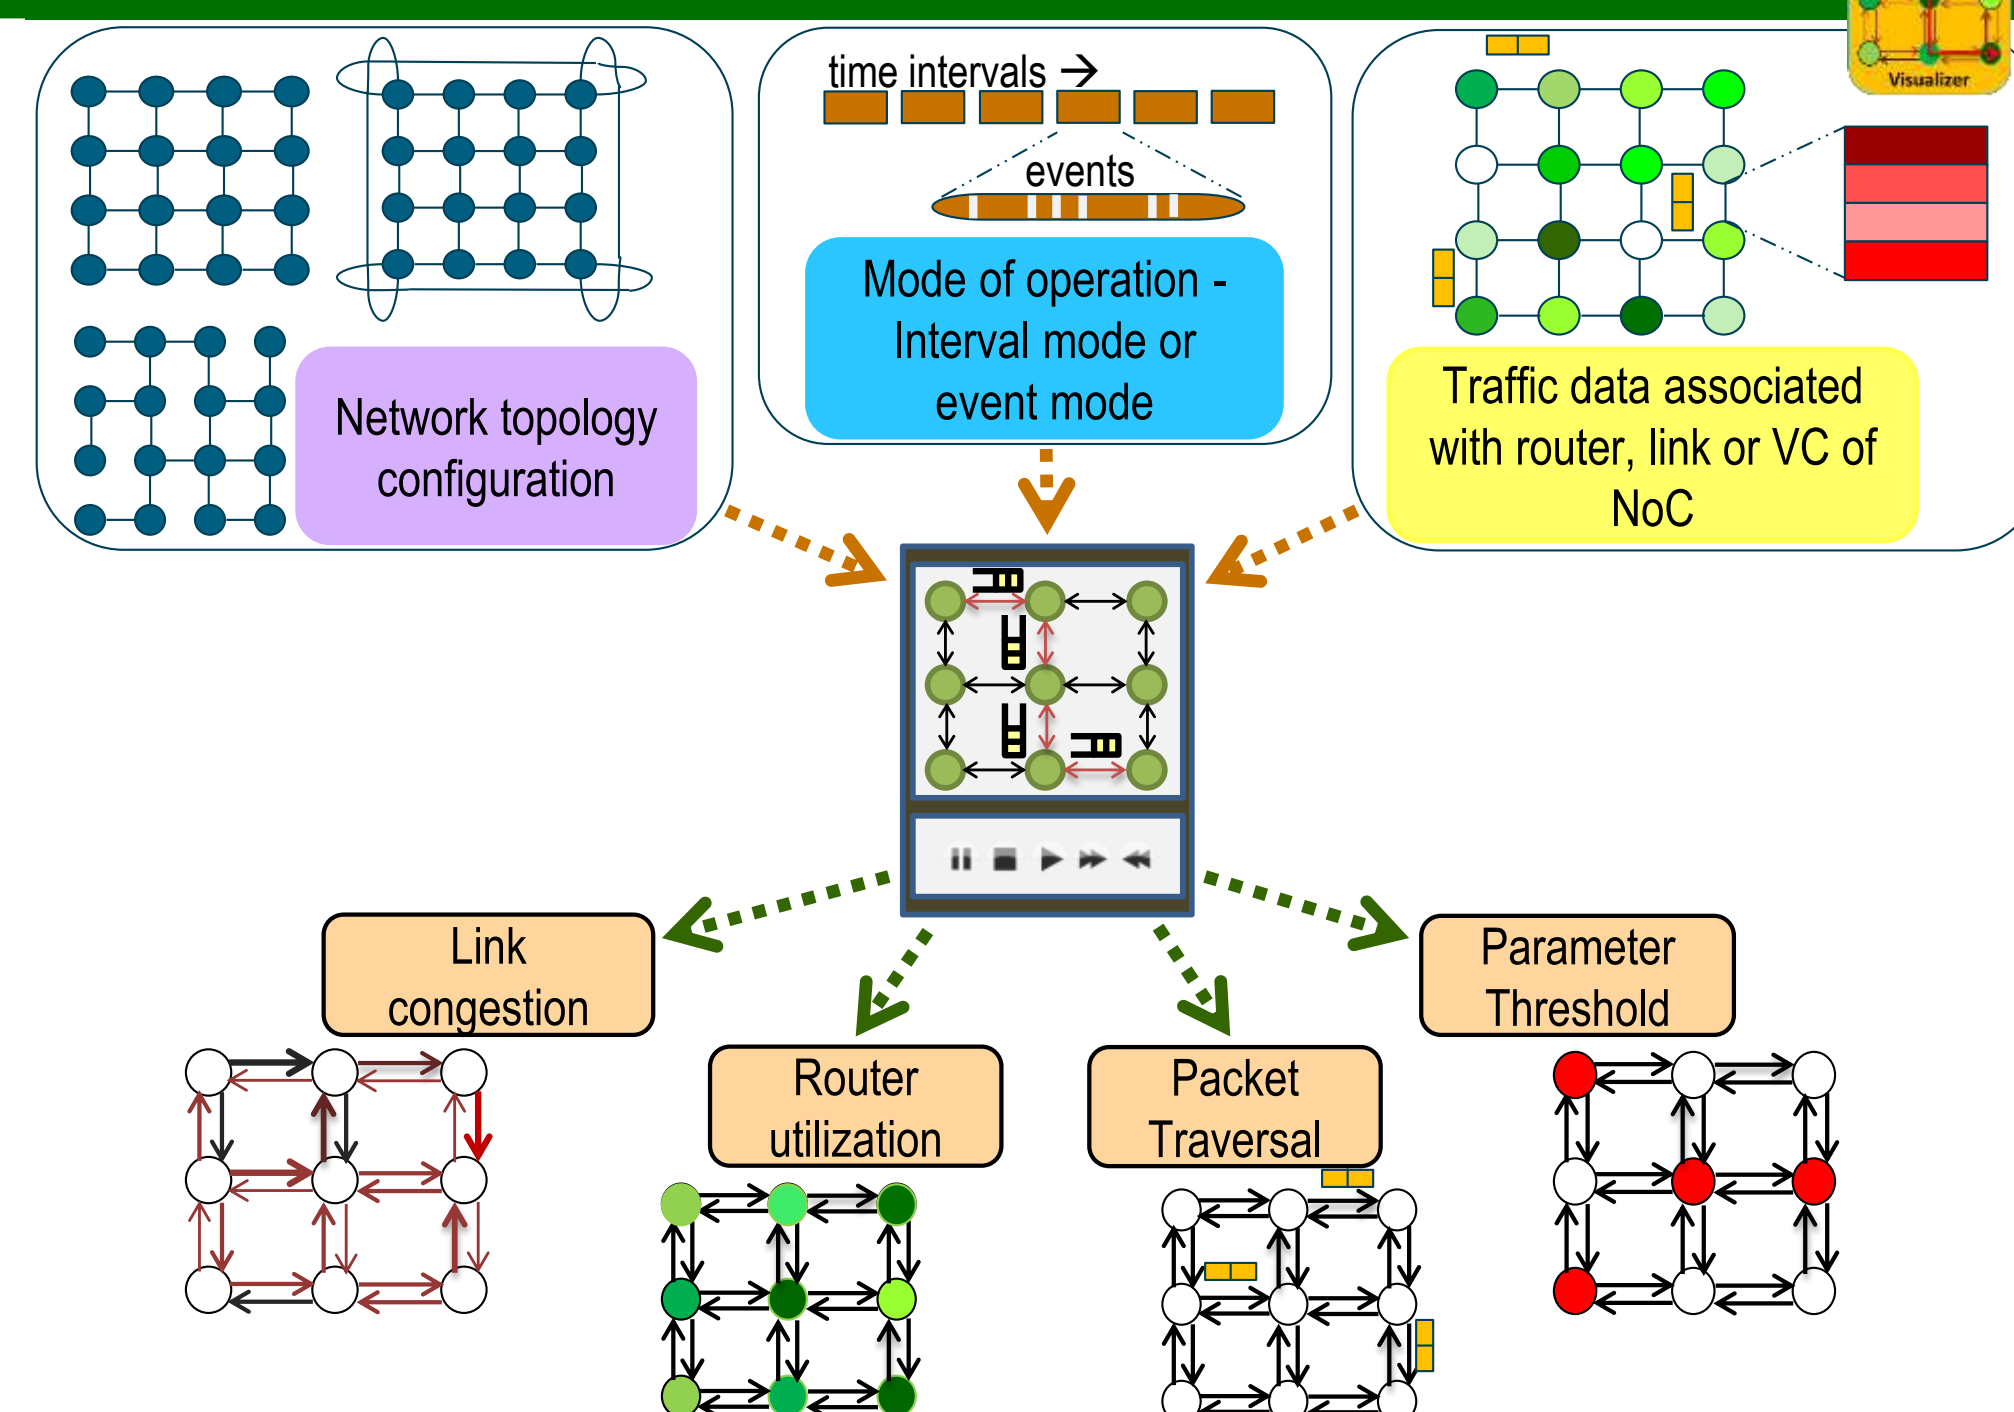

## 6. Reply Timing Model

NoCVision

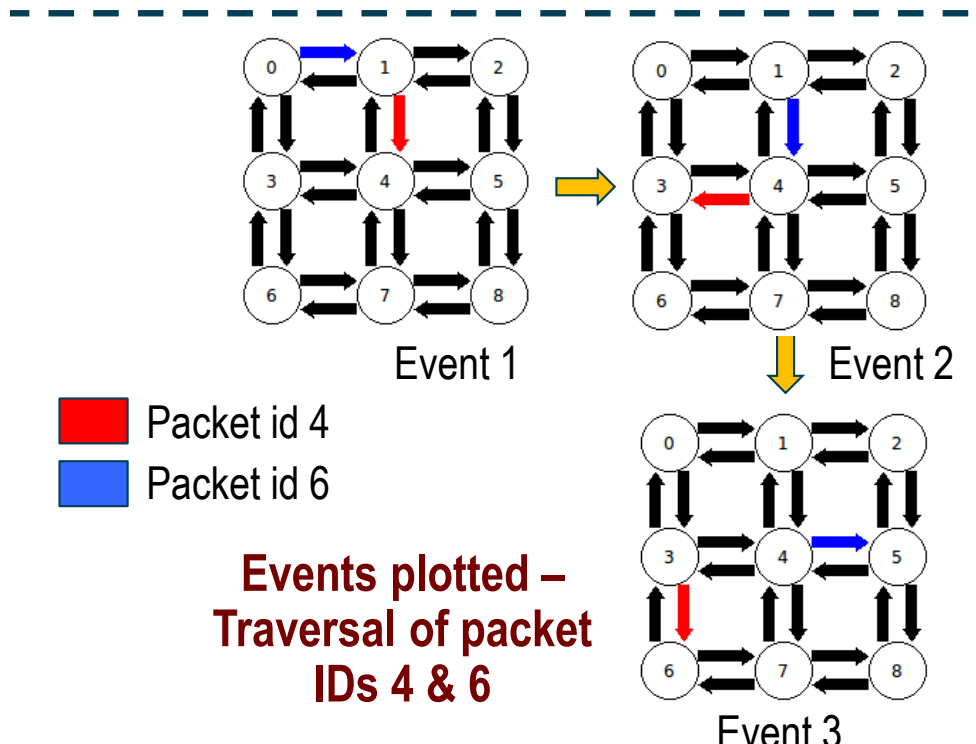

## 7. NoCVision Flow

## 8. NoCVision – Modes of Operation

### Type 1: Interval Mode

- Interval-based packet flow
- Link, router and VC utilization across time windows
- Color intensity represents parameters e.g. congestion, utilization etc.

### Type 2: Event Mode

- Determine region-of-interest and log data for specific events
- Parse through the data across events

## 9. Case-study – High Radix vs. Low Radix

### Application-adaptive topology reconfiguration:

- Employs routers with few ports as in **low-radix** topologies and many links as in **high-radix** routers
- Reconfigures network to enable low-latency path between **heavily communicating src-dest pairs**

NoCVision was used to analyze the routing in various topologies: low-radix, high-radix and hybrid
