

## Written Assignment 1

This assignment asks you to prepare written answers to questions on regular languages and finite automata. Each of the questions has a short answer. You may discuss the assignment with other students and work on the problems together. However, your write-up should be your own individual work.

***Please print your name and email address on your homework!***

We need this information so that we can give you credit for the assignment and so that we can return it to you.

1. Consider the following languages over the alphabet  $\Sigma = \{a, b\}$ .
  - $L_1$  : All strings that contain at least three  $a$ 's.
  - $L_2$  : All strings that contain at most one  $b$ .
  - $L_3$  : All strings that contain at least three  $a$ 's but at most one  $b$ .
  - $L_4$  : All strings that contain no  $b$ 's.

For each of the languages  $L_1$ ,  $L_2$ ,  $L_3$  and  $L_4$ , give a deterministic finite automaton (DFA). (You should thus give four separate DFAs.)

**Aside:** This example illustrates that regular languages are closed under intersection and complementation. Note that  $L_3 = L_1 \cap L_2$  and  $L_4 = \Sigma^* - L_2$  where  $\Sigma^*$  is the language of all strings over the alphabet  $\Sigma$ .

2. Consider the following DFA over the alphabet  $\Sigma = \{a, b\}$ .

Give a one-sentence description of the language recognized by the DFA. Write a regular expression for the same language.

3. Consider the following languages:

- $L_1$  is all strings over the alphabet  $\Sigma = \{x, y\}$  where either  $x$  occurs an odd number of times or  $y$  occurs an odd number of times (or both).
- $L_2$  is all strings over the alphabet  $\Sigma = \{x, y, z\}$  where either  $x$  occurs an odd number of times or  $y$  occurs an odd number of times or  $z$  occurs an odd number of times (or both, or all three).

Give a non-deterministic finite automaton (NFA) for the the languages  $L_1$ . Then give a separate NFA for  $L_2$ .

**Aside:** Non-deterministic finite automata are no more powerful than DFAs in terms of the languages they can describe. They can be exponentially more succinct than DFAs, however.

- Determine whether or not the following languages are regular. Explain why in one or two sentences.
  - $L_1$  is all strings over the alphabet  $\{(, )\}$  where the parentheses are balanced. For example,  $((()(())) \in L_1$  but  $(() \notin L_1$ .
  - $L_2$  is all words that are printed in *Programming Language Pragmatics* by Michael L. Scott.
  - $L_3$  is all 10-digit numbers that are prime.
  - $L_4$  is the Ocaml language (as described in its reference manual). The alphabet is the set of all tokens and the language is the set of all valid Ocaml programs.  $L_4$  is not regular; give two reasons why. **Aside:** This explains why we cannot use a lexer to *parse* languages like Cool or Ruby or C.
- Give one advantage and one disadvantage of system described in Backus' *Speedcoding* paper.

Don't forget to print your name and email address on each page of your writeup.
