The Value of Everything & Procedure Practice

One-Slide Summary

- In Scheme, expressions evaluate to values. Five evaluation rules describe this process.
- Lambda means “make a function”. A lambda expression specifies the formal parameter and the function body.
- Evaluating a function application involves evaluating the function, finding its body, replacing the formal parameters with the evaluated actual arguments, and evaluating the result.

Lecture Outline

- Survey Responses
- Evaluation Rules
  - Lambda
- Problem Set 1
  - Decent Scheme

How To Use Lab Hours

- Read the problems on your own and try them out first.
  - You can not just go to a TA and say “I don’t get it, what do I do.”
    - The TA is allowed to send you away.
  - You must demonstrate about five minutes worth of work: either on scratch paper, or with code you’ve tried and commented out.
    - For example: how would you do it in English?
- Talk to your friends.
- Do not expect to finish the Problem Sets in just the staffed lab time.
  - They take longer. You must do much work alone.

The Forum!

- Your questions for me are answered on the forum.
- Any questions right now?
  - Congrats to Gita B., Hyosang K., and Sarah P. who already have perfect PS1 coding scores …

Who Is Your Hero?

  - CS 1120 Gestalt Student, Fall 2010
  - (first proper name mentioned per response)
Problem Set 1

- Scheme’s Evaluation Rules tell you how to find the value of any expression.
- Questions 1 and 2 ask you to evaluate Scheme expressions in your mind.
  - This is a popular exam question.
- Without Evaluation Rules: guesswork
- Once you know the Evaluation Rules, you can answer without any guessing!

Evaluation Rules

- **Primitives** (* 55 66)
  - Evaluate to their pre-defined values
- **Names** (+ x 2)
  - Evaluate to the value associated with that name
- **Application** (square-root 144)
  - Eval all sub-expressions. Apply the value of the first (a function) to the values of the others.
- **Lambda** (lambda (x) (* x x))
  - Evaluates to a function with parameters and body
- **If** (if (< 3 5) 99 11)
  - Eval predicate. If #f, eval second option. Otherwise, eval the first option.

Primitive Examples

5 --> 5
-88 --> -88
#t --> true (#t)
#f --> false (#f)
+ --> primitive addition

Name Examples

(define x 55)
(define y 66)

What do these evaluate to?

x --> 55
y --> 66
Z --> reference to undefined identifier: z
Application Examples

What do these evaluate to?

(sqrt 16) --> 4
(abs -5) --> 5
(string-length "Hi") --> 2
(+ 1 2) --> 3
(+ 1 2 3) --> 6
(+ 1) --> 1

Liberal Arts Trivia: Anthropology

• This American cultural anthropologist is famous for her studies of Samoa and her reports about the purportedly healthy attitude towards sex in South Pacific and Southeast Asian traditional cultures, which influenced the women's liberation movement (e.g., by claiming that females dominated in Chambri and Papau New Guinea without problems). Five years after she died, her work was challenged by Derek Freeman.

Liberal Arts: Slavic Folklore

• This witch-like character in Slavic folklore lives in a walking house with chicken feet (but no windows and no doors), flies around on a giant mortar, and kidnaps (presumably to eat) small children. Modest Mussorgsky's Pictures at an Exhibition, a piano suite composed in 1874, features "The Hut on Bird's Legs" as its penultimate movement.

Lambda

• Lambda means “make a function”.
• Consider: cube(x) = x * x * x
• Scheme-y: cube(x) = (* x x)
• Lambda: cube = (lambda (x) (* x x))
• Pure Scheme: (define cube (lambda (x) (* x x)))

Anatomy Of A Function

• (define cube (lambda (x) (* x x)))
• (cube 5) --> (* 5 5) -> 125
Lambda Examples

(define cube (lambda (x) (* x x x)))
(define foo (lambda (p q) (+ p q)))
(define bar (lambda (a b c) (* a c)))
(cube 3)  --> (* 3 3 3) -> 27
(foo 5 6)  --> (+ 5 6) -> 11
(bar 4 5 6)  --> (* 4 6) -> 24
(foo (cube 3) 1)  --> ... -> 28

Lambda Lambda Lambda

• Consider these two functions:
  - (define cube (lambda (x) (* x x x)))
  - (define cube (lambda (y) (* y y y)))
• Are they different?
• Consider:
  - (define nail (lambda (x y) (+ x y)))
  - (define polish (lambda (y x) (/ y x)))
• What is:
  - (polish (nail 6 4) 2)  Do this now on paper!
    - (/ y x) -> (/ 10 2) -> 5

If Examples

(if #t “yes” “no”)  -> “yes”
(if #f “yes” “no”)  -> “no”
(if (< 3 5) “ant” “bat”)  -> “bat”
(if (< 5 3) “cat” “dog”)  -> “dog”
(if “x” “y” “z”)  -> “y”
(if (if 11 #f #t) 22 33)  -> 33
Scheme Trickery

- **(100 + 100)**
  - Error: The expression in the first position must be a function (or something special like if). 100 is not a function.

- **(if (not “batterie”) “fouetté” “plié”)**
  - “plié”. (not “batterie”) returns #f, because “batterie” is not #f.
  - *(define (not v) (if v #f #t))*

- **Does (if X #t #f) always equal X?**
  - Yes for #t, #f, (< 3 5), (> 5 6).
  - No for 3, 17, “hello”.

Evaluating expressions and Applying functions are defined in terms of each other.

Without Eval, there would be no Apply. Without Apply, there would be no Eval!

Now You Know All of Scheme!

- Once you understand Eval and Apply, you can understand all Scheme programs!
- Except:
  - There are many primitives, and you need to know their predefined meaning.
  - There are a few more special forms (like if).
  - We have not define the evaluation rules precisely enough to unambiguously understand all programs (e.g., what does “value associated with a name” mean?).

Now On To Problem Set 1

- Smooth transition …

---

**brighter?**

```scheme
(define brighter? (lambda (color1 color2) (if (> (+ (get-red color1) (get-green color1) (get-blue color1)) (+ (get-red color2) (get-green color2) (get-blue color2))) #t #f)))
```

Is this correct?

Maybe...but very hard to tell. Your code should appear in a way that reveals its structure

Use [Tab] in DrScheme to line up your code structurally!
Brighter brighter??

(define brighter? 
  (lambda (color1 color2) 
     (> (+ (get-red color1)
          (get-green color1)
          (get-blue color1))
        (+ (get-red color2)
           (get-green color2)
           (get-blue color2))))

What can we do about this duplicated code?

Believable brighter??

(define brightness 
  (lambda (color)
       (+ (* 0.299 (get-red color))
          * 0.587 (get-green color))
          * 0.114 (get-blue color))))
(define brighter? 
  (lambda (color1 color2) 
     (> (brightness color1)
        (brightness color2)))

Color Absorbed

(liberal Arts Trivia: Physics

• This 1797 torsion balance experiment, sometimes called “weighing the earth”, was the first to measure the force of gravity between masses in the laboratory, and the first to yield accurate values of the gravitational constant and thus the mass of the Earth.
Liberal Arts Trivia: Grab Bag
• Q. This series of music video games was produced by Konami in 1998. The series pioneered the rhythm and dance genre in video games. Players stand on a “dance platform” or stage and hit colored arrows laid out in a cross with their feet in time with musical and visual cues.

What should you do if you can’t get your code to work?
• Keep trying: think of alternate approaches
• Get help from the TAs and your classmates
• But, if it’s too late for that …
  - In your submission, explain what doesn’t work and as much as you can what you think is right and wrong
• If you get less than 50% on the automatic adjudication part, the TAs will look over your source and give partial credit.

Evaluation Rules
• A formal review and study guide follows …

Primitive Expressions
Expression ::= PrimitiveExpression
PrimitiveExpression ::= Number
PrimitiveExpression ::= #t | #f
PrimitiveExpression ::= Primitive Procedure

Evaluation Rule 1: Primitive. If the expression is a primitive, it evaluates to its pre-defined value.

> +
#<primitive:+>

Name Expressions
Expression ::= NameExpression
NameExpression ::= Name

Evaluation Rule 2: Name. If the expression is a name, it evaluates to the value associated with that name.

> (define two 2)
> two
2
Definitions

**Definition**: \( (\text{define} \ Name \ Expression) \)

**Definition Rule.** A definition evaluates the \( Expression \), and associates the value of \( Expression \) with \( Name \).

\[ \texttt{> (define dumb (+ + +))} \]
\[ \texttt{+: expects type <number> as 1st argument, given: #<primitive:+>; other arguments were: #<primitive:+>} \]
\[ \texttt{> dumb} \]
\[ \texttt{reference to undefined identifier: dumb} \]

Application Expressions

**Expression**: \( ApplicationExpression \)

**ApplicationExpression**: \( (Expression \ MoreExpressions) \)

**MoreExpressions**: \( \varepsilon \ | \ Expression \ MoreExpressions \)

**Evaluation Rule 3: Application.** To evaluate an application expression:

- **a. Evaluate** all the subexpressions;
- **b. Then, apply** the value of the first subexpression to the values of the remaining subexpressions.

> ((lambda (n) (+ n 1)) 2)

Evaluation Rule 3a: evaluate the subexpressions

\[ ((\text{lambda} \ (n) (+ \ n \ 1)) \ 2) \]

Evaluation Rule 3b, Application Rule 2

\[ (+ \ 2 \ 1) \]

Evaluation Rule 3a, 3b, Application Rule 1

3

Rules for Application

- **Primitive.** If the procedure to apply is a \emph{primitive}, just do it.

- **Constructed Procedure.** If the procedure is a \emph{constructed (lambda) procedure}, \emph{evaluate} the body of the procedure with each formal parameter replaced by the corresponding actual argument expression value.

Constructing Procedures: Lambda

**Expression**: \( ProcedureExpression \)

**ProcedureExpression**

\[ := (\text{lambda} \ (Parameters) \ Expression) \]

**Parameters**: \( \varepsilon \ | \ Name \ Parameters \)

**Evaluation Rule 4: Lambda.** Lambda expressions evaluate to a procedure that takes the given \( Parameters \) as inputs and has the \( Expression \) as its body.

Applying Constructed Procedures

**Application Rule 2: Constructed Procedure.** If the procedure is a \emph{constructed (lambda) procedure}, \emph{evaluate} the body of the procedure with each formal parameter replaced by the corresponding actual argument expression value.

\[ > ((\text{lambda} \ (n) (+ \ n \ 1)) \ 2) \]

Evaluation Rule 3a: evaluate the subexpressions

\[ ((\text{lambda} \ (n) (+ \ n \ 1)) \ 2) \]

Evaluation Rule 3b, Application Rule 2

\[ (+ \ 2 \ 1) \]

Evaluation Rule 3a, 3b, Application Rule 1

3
Evaluation Rule 5: If

\[
\text{Expression ::= (if Expression}_{\text{Predicate}} \quad \text{Expression}_{\text{Consequent}} \quad \text{Expression}_{\text{Alternate}})\]

**Evaluation Rule 5: If.** To evaluate an if expression:
- Evaluate the predicate expressions.
- If it evaluates to \#f, the value of the if expression is the value of alternate expression. Otherwise, the value of the if expression is the value of consequent expression.

Lambda Example: Tautology Function

\[
(\lambda \quad \text{make a procedure}

() \quad \text{with no parameters}

\#t) \quad \text{with body \#t}
\]

> ((lambda () \#t) 150)
> #<procedure>: expects no arguments, given 1: 150
> ((lambda () \#t))
> #t
> ((lambda (x) x) 150)
> 150

Homework

- (In theory) You now know everything you need for PS1, PS2, PS3 and PS4 ...
- Honor Pledge due today (now!)
- Problem Set 1 due Monday September 6
  - ... at 3:30pm
