

# Having a BLAST with SLAM

Topic:

# Software Model Checking via Counter-Example Guided Abstraction Refinement

- There are easily two dozen SLAM/BLAST/MAGIC papers; I will skim.

# SLAM Overview

- INPUT: Program and Specification
  - Standard C Program (pointers, procedures)
  - Specification = Partial Correctness
    - Given as a finite state machine (typestate)
    - “I use locks correctly”, *not* “I am a webserver”
- OUTPUT: Verified or Counterexample
  - Verified = program does not violate spec
    - Can come with proof!
  - Counterexample = concrete bug instance
    - A path through the program that violates the spec

# Take-Home Message

- **SLAM** is a **software model checker**. It **abstracts** C programs to **boolean programs** and model-checks the boolean programs.
- No errors in the boolean program implies no errors in the original.
- An error in the boolean program **may** be a real bug. Or SLAM may **refine** the abstraction and start again.

# Property 1: Double Locking

*“An attempt to re-acquire an acquired lock or release a released lock will cause a **deadlock**.”*

Calls to **lock** and **unlock** must **alternate**.

# Property 2: Drop Root Privilege

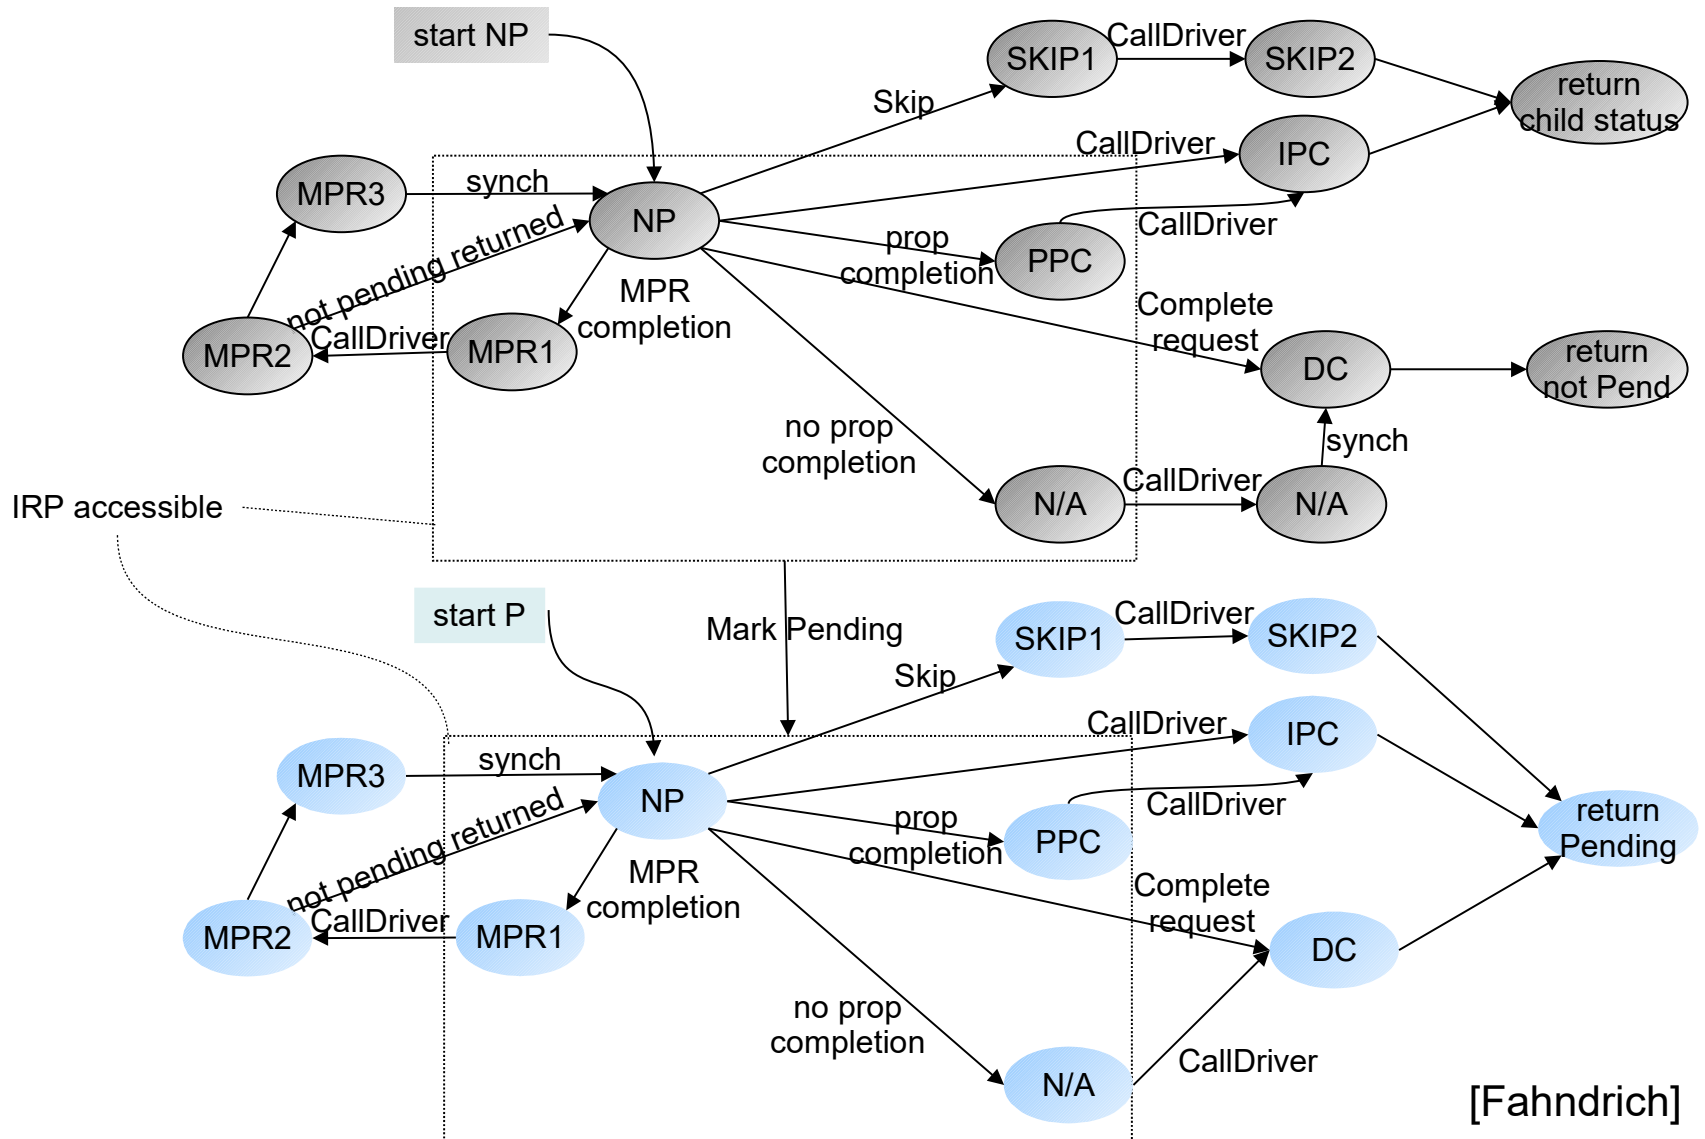

[Chen-Dean-Wagner '02]

*“User applications must not run with root privilege”*

When **execv** is called, must have **suid  $\neq$  0**

# Property 3 : IRP Handler

# Example SLAM Input

```
Example ( ) {  
1: do{  
    lock ();  
    old = new;  
    q = q->next;  
2:    if (q != NULL) {  
3:        q->data = new;  
        unlock ();  
        new ++;  
    }  
4: } while(new != old);  
5: unlock ();  
    return;  
}
```

# SLAM in a Nutshell

```
SLAM(Program p, Spec s) = // program
  Program q = incorporate_spec(p,s); // slic
  mutable PredicateSet abs = { };
  while true do
    BooleanProgram b = abstract(q,abs); // c2bp
    match model_check(b) with // bebop
    | No_Error → printf("no bug"); exit(0)
    | Counterexample(c) →
      if is_valid_path(c, p) then // newton
        printf("real bug"); exit(1)
      else
        abs ← abs ∪ new_preds(c) // newton
  done
```

# Incorporating Specs

```
Example ( ) {  
1: do{  
    lock();  
    old = new;  
    q = q->next;  
2:   if (q != NULL){  
3:     q->data = new;  
     unlock();  
     new ++;  
    }  
4: } while(new != old);  
5: unlock();  
   return;  
}
```

```
Example ( ) {  
1: do{  
    if L=1 goto ERR;  
    else L=1;  
    old = new;  
    q = q->next;  
2:   if (q != NULL){  
3:     q->data = new;  
     if L=0 goto ERR;  
     else L=0;  
     new ++;  
    }  
4: } while(new != old);  
5:   if L=0 goto ERR;  
    else L=0;  
    return;  
ERR: abort();  
}
```

*Original program  
violates spec iff  
new program  
reaches ERR*

# Program As Labeled Transition System

*State*

*Transition*

$pc \mapsto 3$   
 $lock \mapsto \bullet$   
 $old \mapsto 5$   
 $new \mapsto 5$   
 $q \mapsto 0x133a$

```

3: unlock ();
   new++;
4: } ...
    
```

$pc \mapsto 4$   
 $lock \mapsto \circ$   
 $old \mapsto 5$   
 $new \mapsto 6$   
 $q \mapsto 0x133a$

```

Example ( ) {
1: do {
   lock ();
   old = new;
   q = q->next;
2:   if (q != NULL){
3:     q->data = new;
       unlock ();
       new ++;
   }
4: } while(new != old);
5: unlock ();
   return; }
    
```

# The Safety Verification Problem

Is there a **path** from an **initial** to an **error** state ?

**Problem:** Infinite state graph (old=1, old=2, old=...)

**Solution :** Set of states  $\simeq$  logical formula

# Representing [Sets of States] as *Formulas*

$[F]$

states satisfying  $F$   $\{s \mid s \models F\}$

$F$

FO fmla over prog. vars

$[F_1] \cap [F_2]$

$F_1 \wedge F_2$

$[F_1] \cup [F_2]$

$F_1 \vee F_2$

$\overline{[F]}$

$\neg F$

$[F_1] \subseteq [F_2]$

$F_1 \Rightarrow F_2$

i.e.  $F_1 \wedge \neg F_2$  unsatisfiable

# Abstract States and Transitions

## State

$pc \mapsto 3$   
 $lock \mapsto \bullet$   
 $old \mapsto 5$   
 $new \mapsto 5$   
 $q \mapsto 0x133a$

```

3: unlock();
   new++;
4: } ...
    
```

$pc \mapsto 4$

# Abstraction

## State

# Analyze Abstraction

Analyze finite graph

**Over** Approximate:

Safe  $\Rightarrow$  System Safe

No **false negatives**

**Problem**

Spurious **counterexamples**

# Idea 2: Counterex.-Guided Refinement

## Solution

Use spurious **counterexamples** to **refine** abstraction!

# Idea 2: Counterex.-Guided Refinement

## Solution

Use spurious **counterexamples** to **refine** abstraction

1. **Add predicates** to distinguish states across **cut**
2. Build **refined** abstraction

Imprecision due to **merge**

# Iterative Abstraction-Refinement

[Kurshan et al 93] [Clarke et al 00]  
[Ball-Rajamani 01]

## Solution

Use spurious **counterexamples** to **refine** abstraction

1. Add predicates to distinguish states across **cut**
2. Build **refined** abstraction  
-eliminates counterexample
3. **Repeat** search

Until real counterexample  
or system proved safe

# Problem: Abstraction is Expensive

Reachable

## Problem

#abstract states =  $2^{\text{\#predicates}}$

Exponential Thm. Prover queries

## Observe

Fraction of state space reachable

#Preds ~ 100's, #States ~  $2^{100}$ ,

#Reach ~ 1000's

# Solution 1: Only Abstract Reachable States

Safe

## Problem

#abstract states =  $2^{\text{\#predicates}}$

Exponential Thm. Prover queries

## Solution

Build abstraction **during** search

# Solution2: Don't Refine Error-Free Regions

## Problem

#abstract states =  $2^{\text{\#predicates}}$

Exponential Thm. Prover queries

## Solution

Don't refine error-free regions

Q: Books (704 / 842)

- In T.S. Eliot's 1939 **Old Possum's Book Of Practical Cats**, this *"mystery cat is called the hidden paw / for he's a master criminal who can defy the law."*

# Q: Computer Science

- This American Turing award winner is sometimes called the “father” of analysis of algorithms, and is known for popularizing asymptotic notation, creating TeX, and co-developing a popular a string search algorithm. His most famous work is *The Art of Computer Programming*.

# Key Idea: Reachability Tree

## Unroll Abstraction

1. Pick tree-node (=abs. state)
2. Add children (=abs. successors)
3. On **re-visiting** abs. state, **cut-off**

## Find min infeasible suffix

- Learn new predicates
- Rebuild subtree with new preds.

# Key Idea: Reachability Tree

Error Free

# SLAM Summary

- 1) Instrument Program With Safety Policy
- 2) Predicates = { }
- 3) Abstract Program With Predicates
  - Use **Weakest Preconditions and Theorem Prover Calls**
- 4) Model-Check Resulting Boolean Program
  - Use **Symbolic Model Checking**
- 5) Error State Not Reachable?
  - Original Program Has **No Errors: Done!**
- 6) Check Counterexample Feasibility
  - Use **Symbolic Execution**
- 7) Counterexample Is Feasible?
  - Real **Bug: Done!**
- 8) Counterexample Is Not Feasible?
  - 1) Find New Predicates (Refine Abstraction)
  - 2) Goto Line 3

# Optional: SLAM Weakness

```
1: F() {  
2:   int x=0;  
3:   lock();  
4:   do x++;  
5:   while (x ≠ 88);  
6:   if (x < 77)  
7:     lock();  
8: }
```

- Preds = {}, Path = 234567
- $[x=0, \neg x+1=88, x+1<77]$
- Preds = { $x=0$ }, Path = 234567
- $[x=0, \neg x+1=88, x+1<77]$
- Preds = { $x=0, x+1=88$ }
- Path = 23454567
- $[x=0, \neg x+2=88, x+2<77]$
- Preds = { $x=0, x+1=88, x+2=88$ }
- Path = 2345454567
- ...
- Result: the predicates “count”  
the loop iterations
