Winter 2021, University of Michigan

<https://web.eecs.umich.edu/~justincj/teaching/eecs442/WI2021/>

Recap: Motivation

1: find corners+features

Last Time – Gradients

Image gradients – treat image like function of x, y – gives edges, corners, etc.

$$\nabla f = \left[\frac{\partial f}{\partial x}, 0 \right]$$

$$\nabla f = \left[0, \frac{\partial f}{\partial y} \right]$$

$$\nabla f = \left[\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y} \right]$$

Last Time – Corner Detection

Can localize the location, or any shift →
big intensity change.

“flat” region:
no change in
all directions

“edge”:
no change
along the edge
direction

“corner”:
significant
change in all
directions

Last Time – Corner Detection

Zoom-In at x, y

Window with and w/o Offset

“Window”
At $x+u, y+v$
Here: $u=-2, v=-3$

“Window”
At x, y

Last Time – Corner Detection

Zoom-In at x, y

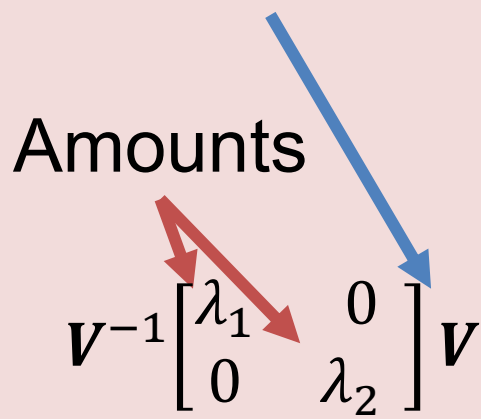

Error (Sum Sqs) for u, v offset

$$E(u, v) = \sum_{(x, y) \in W} (I[x + u, y + v] - I[x, y])^2$$

$$\left(\begin{array}{c} \text{Red Box} \\ \text{Blue Box} \end{array} \right)^2$$

Last Time –Corner Detection

TL;DR: Taylor expansion for error $E(u,v)$. All terms in equation are sums of image gradients and in \mathbf{M}

<p><u>Should know</u></p> <p>Can compute at each pixel</p> $\mathbf{M} = \begin{bmatrix} \sum_{x,y \in W} I_x^2 & \sum_{x,y \in W} I_x I_y \\ \sum_{x,y \in W} I_x I_y & \sum_{x,y \in W} I_y^2 \end{bmatrix} =$ <p>$I_x = I_x$ at point (x,y), $I_y = I_y$ at point (x,y)</p>	<p><u>Optional</u></p> <p>Directions</p> <p>Amounts</p>  $\mathbf{V}^{-1} \begin{bmatrix} \lambda_1 & 0 \\ 0 & \lambda_2 \end{bmatrix} \mathbf{V}$
--	--

Putting It Together

$$R = \det(\mathbf{M}) - \alpha \text{trace}(\mathbf{M})^2 \\ = \lambda_1 \lambda_2 - \alpha(\lambda_1 + \lambda_2)^2$$

α : constant (0.04 to 0.06)

Calculating eigenvalues
is usually slow!

Determinant, trace have
closed form solution

In Practice

1. Compute partial derivatives I_x , I_y per pixel
2. Compute \mathbf{M} at each pixel, using Gaussian weighting w

$$\mathbf{M} = \begin{bmatrix} \sum_{x,y \in W} w(x,y) I_x^2 & \sum_{x,y \in W} w(x,y) I_x I_y \\ \sum_{x,y \in W} w(x,y) I_x I_y & \sum_{x,y \in W} w(x,y) I_y^2 \end{bmatrix}$$

C.Harris and M.Stephens. [“A Combined Corner and Edge Detector.”](#)
Proceedings of the 4th Alvey Vision Conference: pages 147—151, 1988.

In Practice

1. Compute partial derivatives I_x , I_y per pixel
2. Compute \mathbf{M} at each pixel, using Gaussian weighting w
3. Compute response function R

$$\begin{aligned} R &= \det(\mathbf{M}) - \alpha \operatorname{trace}(\mathbf{M})^2 \\ &= \lambda_1 \lambda_2 - \alpha (\lambda_1 + \lambda_2)^2 \end{aligned}$$

C.Harris and M.Stephens. ["A Combined Corner and Edge Detector."](#)
Proceedings of the 4th Alvey Vision Conference: pages 147—151, 1988.

Computing R

Computing R

In Practice

1. Compute partial derivatives I_x , I_y per pixel
2. Compute \mathbf{M} at each pixel, using Gaussian weighting w
3. Compute response function R
4. Threshold R

C.Harris and M.Stephens. ["A Combined Corner and Edge Detector."](#)
Proceedings of the 4th Alvey Vision Conference: pages 147—151, 1988.

Thresholded R

In Practice

1. Compute partial derivatives I_x , I_y per pixel
2. Compute \mathbf{M} at each pixel, using Gaussian weighting w
3. Compute response function R
4. Threshold R
5. Take only local maxima (called non-maxima suppression)

C.Harris and M.Stephens. ["A Combined Corner and Edge Detector."](#)
Proceedings of the 4th Alvey Vision Conference: pages 147—151, 1988.

Thresholded

Final Results

Desirable Properties

If our detectors are repeatable, they should be:

- **Invariant** to some things: image is transformed and corners remain the same
- **Covariant/equivariant** with some things: image is transformed and corners transform with it.

Recall Motivating Problem

Images may be different in lighting and geometry

Affine Intensity Change

$$I_{new} = aI_{old} + b$$

M only depends on derivatives, so b is irrelevant

But a scales derivatives and there's a threshold

Partially invariant to affine intensity changes

Image Translation

All done with convolution. Convolution is translation equivariant.

Equivariant with translation

Image Rotation

Rotations just cause the corner rotation matrix to change. Eigenvalues remain the same.

Equivariant with rotation

Image Scaling

One pixel can become many pixels and vice-versa.

Not equivariant with scaling

How do we fix this?

Recap: Motivation

1: find corners+features

2: match based on local image data

How?

Today

- Fixing scaling by making detectors in both location **and scale**
- Enabling matching between features by **describing regions**

Key Idea: Scale Space

Left to right: each image is half-sized
Upsampled with big pixels below

Note: I'm also slightly blurring to prevent aliasing (<https://en.wikipedia.org/wiki/Aliasing>)

Key Idea: Scale Space

Left to right: each image is half-sized

If I apply a $K \times K$ filter, how much of the original image does it see in each image?

Note: I'm also slightly blurring to prevent aliasing (<https://en.wikipedia.org/wiki/Aliasing>)

Solution to Scales

Try them all!

$$* \text{ [blob filter] } =$$

Find maxima *and minima* of blob filter response in
scale *and space*

Gaussian Derivatives

Gaussian

1st Deriv

$$\frac{\partial}{\partial y} g$$

2nd Deriv

$$\frac{\partial^2}{\partial^2 y} g$$

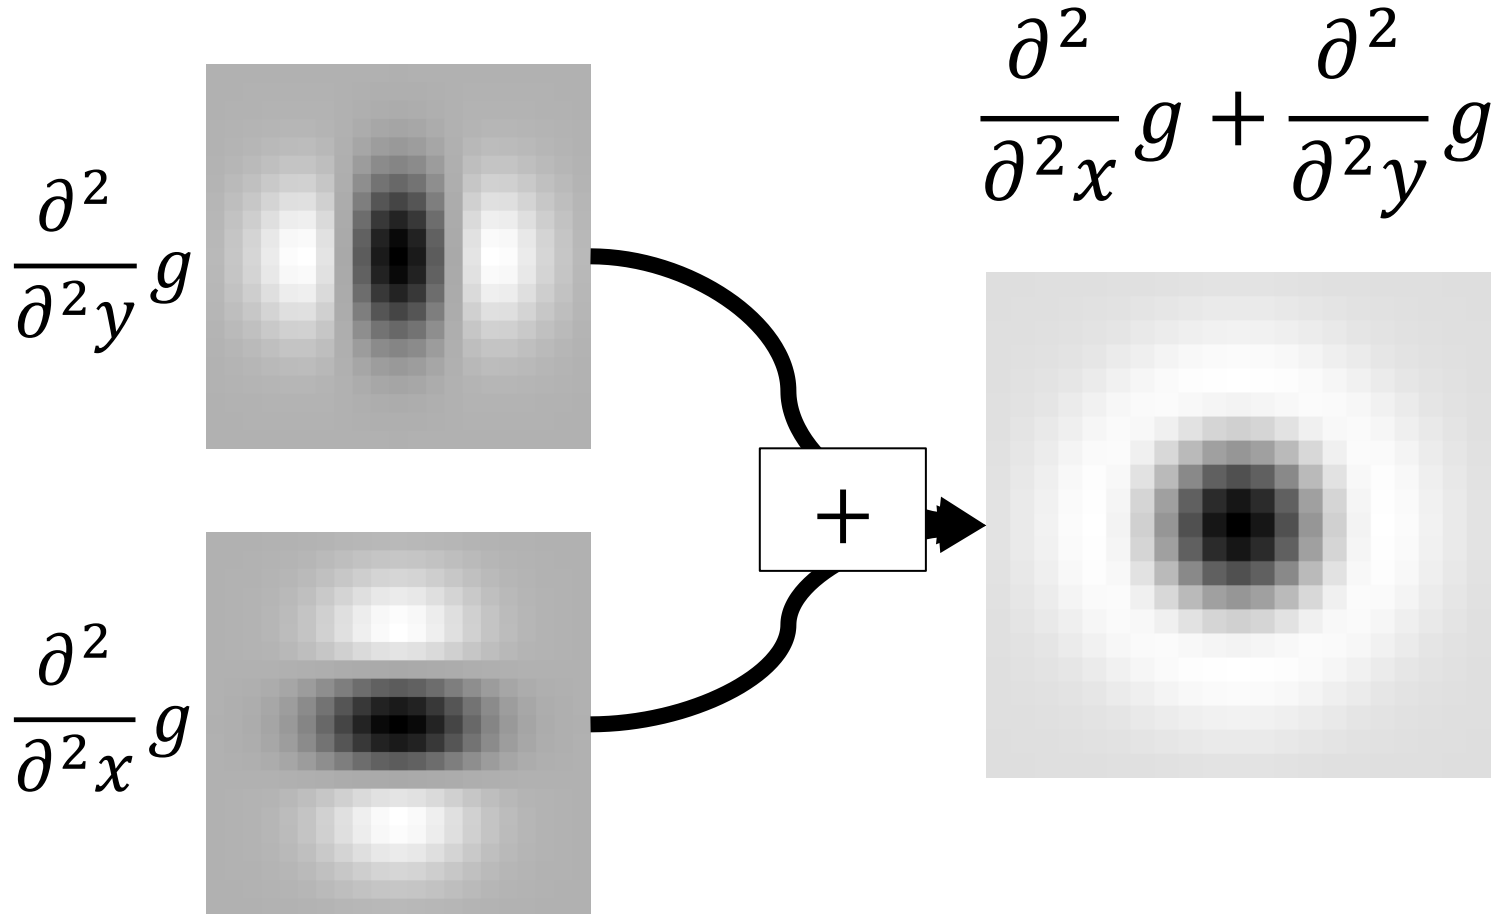

$$\frac{\partial}{\partial x} g$$

$$\frac{\partial^2}{\partial^2 x} g$$

Laplacian of Gaussian (LoG)

Slight detail: for technical reasons, you need to scale the Laplacian of Gaussian if you want to compare across sigmas.

$$\nabla_{norm}^2 = \sigma^2 \left(\frac{\partial^2}{\partial x^2} g + \frac{\partial^2}{\partial y^2} g \right)$$

Edge Detection with LoG

f

Edge

$\frac{\partial^2}{\partial^2 x} g$

Laplacian
Of Gaussian

Scale Selection

Given binary circle and Laplacian filter of scale σ , we can compute the response as a function of the scale.

Characteristic Scale

Characteristic scale of a blob is the scale that produces the maximum response

Image

Abs. Response

Scale-space blob detector

1. Convolve image with scale-normalized Laplacian at several scales

Scale-space blob detector: Example

Scale-space blob detector: Example

sigma = 11.9912

Scale-space blob detector

1. Convolve image with scale-normalized Laplacian at several scales
2. Find maxima of squared Laplacian response in scale-space

Finding Maxima

Point i,j is maxima (minima if you flip sign) in image I if it's bigger than all neighbors

```
for y=range(i-1,i+1+1):
```

```
    for x in range(j-1,j+1+1):
```

```
        if y == i and x == j: continue
```

```
        #below has to be true
```

```
        I[y,x] < I[i,j]
```

Scale Space

Blue lines are image-space neighbors (should be just one pixel over but that's impossible to draw)

Scale Space

Red lines are the scale-space neighbors

Finding Maxima

Suppose $I[:, :, k]$ is image at scale k . Point i, j, k is maxima (minima if you flip sign) in image I if:

for y in range($i-1, i+1+1$):

 for x in range($j-1, j+1+1$):

 for c in range($k-1, k+1+1$):

 if $y == i$ and $x == j$ and $c == k$:

 continue

 #below has to be true

$I[y, x, c] < I[i, j, k]$

Scale-space blob detector: Example

Efficient implementation

- Approximating the Laplacian with a difference of Gaussians:

$$L = \sigma^2 \left(G_{xx}(x, y, \sigma) + G_{yy}(x, y, \sigma) \right)$$

(Laplacian)

$$DoG = G(x, y, k\sigma) - G(x, y, \sigma)$$

(Difference of Gaussians)

Efficient implementation

David G. Lowe. ["Distinctive image features from scale-invariant keypoints."](#) *IJCV* 60 (2), pp. 91-110, 2004.

Slide credit: S. Lazebnik

Problem 1 Solved

- How do we deal with scales: try them all
- **Why is this efficient?**

Vast majority of effort is in the first and second scales

$$1 + \frac{1}{4} + \frac{1}{16} + \frac{1}{64} + \frac{1}{4^i} \dots = \frac{4}{3}$$

Problem 2 – Describing Features

Image – 40

1/2 size, rot. 45°
Lightened+40

Full
Image

100x100 crop
at Glasses

Problem 2 – Describing Features

Once we've found a corner/blobs, we can't just use the image nearby. What about:

1. Scale?
2. Rotation?
3. Additive light?

Handling Scale

Given characteristic scale (maximum Laplacian response), we can just rescale image

Handling Rotation

Given window, can compute “dominant orientation”
and then rotate image

Scale and Rotation

SIFT features at characteristic scales and dominant orientations

Scale and Rotation

SIFT Descriptors

1. Compute gradients
2. Build histogram (2x2 here, 4x4 in practice)

Gradients ignore global illumination changes

SIFT Descriptors

- In principle: build a histogram of the gradients
- In reality: quite complicated
 - Gaussian weighting: smooth response
 - Normalization: reduces illumination effects
 - Clamping
 - Tons of more stuff

Properties of SIFT

- Can handle: up to ~ 60 degree out-of-plane rotation, changes of illumination
- Fast, efficient, code available (but was patented)

Feature Descriptors

Think of feature as some non-linear filter that maps pixels to 128D feature

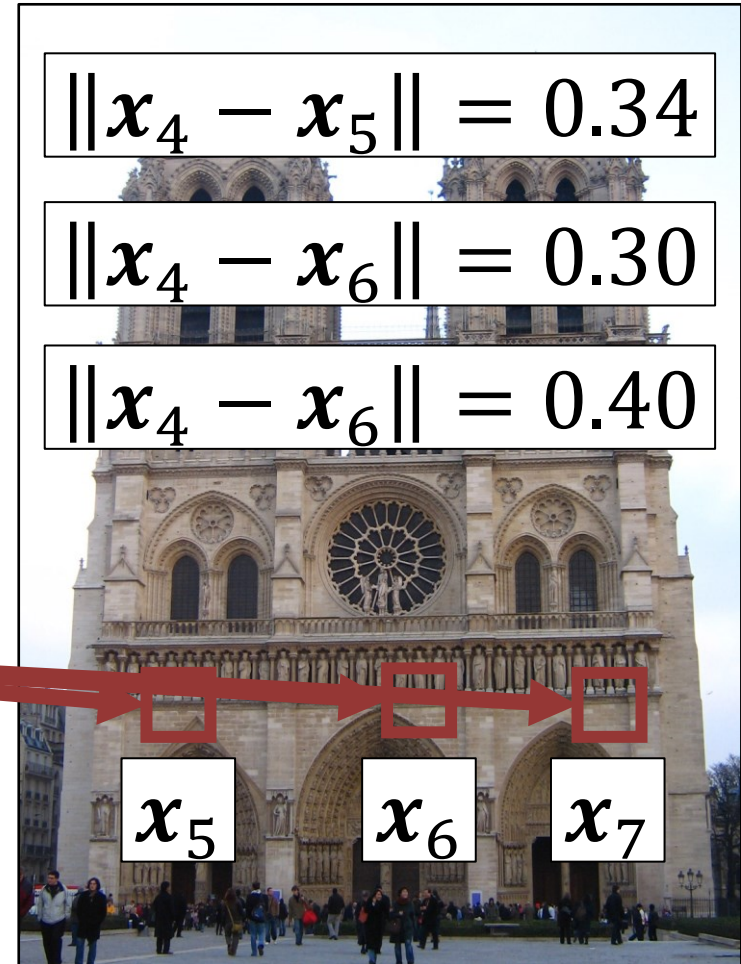

128D
vector x

Instance Matching

Instance Matching

2nd Nearest Neighbor Trick

- Given a feature \mathbf{x}_q , nearest neighbor to \mathbf{x} is a good match, but distances can't be thresholded.
- Instead, find nearest neighbor (\mathbf{x}_{1NN}) and second nearest neighbor (\mathbf{x}_{2NN}). This ratio is a good test for matches:

$$r = \frac{\|\mathbf{x}_q - \mathbf{x}_{1NN}\|}{\|\mathbf{x}_q - \mathbf{x}_{2NN}\|}$$

2nd Nearest Neighbor Trick

So Far; What's Next?

1: find corners+features

2: match based on local image data

3: next time: compute offsets from matches

Extra Reading for the Curious

Aside: This Trick is Common

Given a 50×16 person detector, how do I detect:
(a) 250×80 (b) 150×48 (c) 100×32 (d) 25×8 people?

Sample people from image

Aside: This Trick is Common

Detecting all the people
The red box is a fixed size

Sample people from image

Affine adaptation

Consider the second moment matrix of the window containing the blob:

$$M = \sum_{x,y} w(x,y) \begin{bmatrix} I_x^2 & I_x I_y \\ I_x I_y & I_y^2 \end{bmatrix} = R^{-1} \begin{bmatrix} \lambda_1 & 0 \\ 0 & \lambda_2 \end{bmatrix} R$$

Recall:

$$\begin{bmatrix} u & v \end{bmatrix} M \begin{bmatrix} u \\ v \end{bmatrix} = \text{const}$$

This ellipse visualizes the “characteristic shape” of the window
