## Signals (only most common)

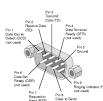

13

- The <u>RXD</u> signal of a UART is the signal receiving the data. This will be an input and is usually connected to the TXD line of the downstream device.
- The <u>TXD</u> signal of a UART is the signal transmitting the data. This
  will be an output and is usually connected to the RXD line of the
  downstream device.
- The <u>RTS#</u> (Ready to Send) signal of a UART is used to indicate to the downstream device that the device is ready to receive data. This will be an output and is usually connected to the CTS# line of the downstream device.
- The <u>CTS#</u>(Clear to Send) signal of a UART is used by the downstream device to identify that it is OK to transmit data to the upsteam device. This will be an input and is usually connected to the RTS# line of the upstream device.

DB9 stuff

- DTE vs DCE
- Pinout of a DCE?
- Common ground?
- Noise effects?

| Pin<br>Number | Signal | Description         |  |
|---------------|--------|---------------------|--|
| 1             | DCD    | Data carrier detect |  |
| 2             | RxD    | Receive Data        |  |
| 3             | TxD    | Transmit Data       |  |
| 4             | DTR    | Data terminal ready |  |
| 5             | GND    | Signal ground       |  |
| 6             | DSR    | Data set ready      |  |
| 7             | RTS    | Ready to send       |  |
| 8             | CTS    | Clear to send       |  |
| 9             | RI     | Ring Indicator      |  |
|               |        |                     |  |

DCE Side Received Data

- Clear to Send 4

Request to Send 5

ed Data 3

14

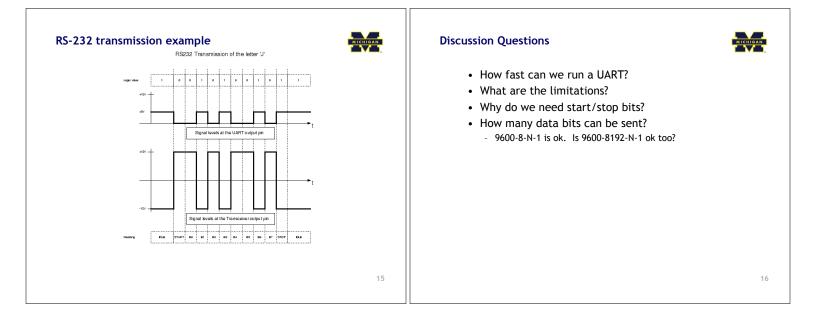

Wiring a DTE device to a DCE device for communication is easy. The pins are a one-to-one connection, meaning all wires go from pin x to pin x. A straight through cable is commonly used for this application. In contrast, wiring two DTE devices together requires crossing the transmit and receive wires This cable is known as a null modern or crossover cable.

4 Request to Send

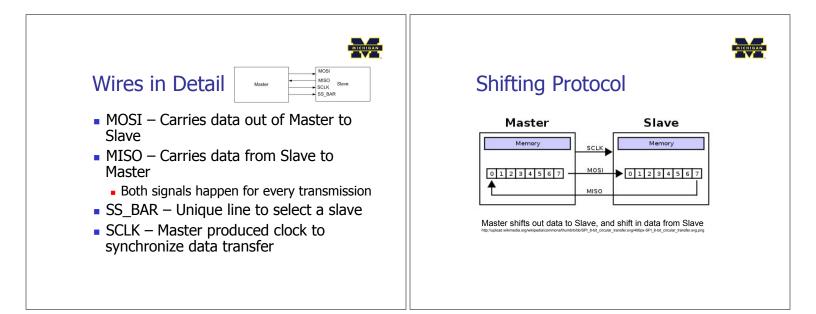

5 Gearto Send 🔫

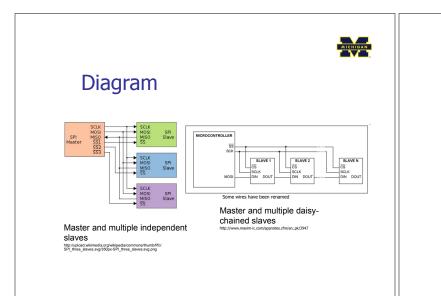

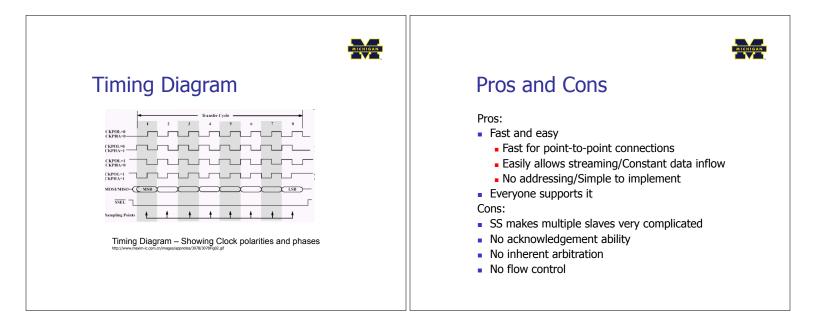

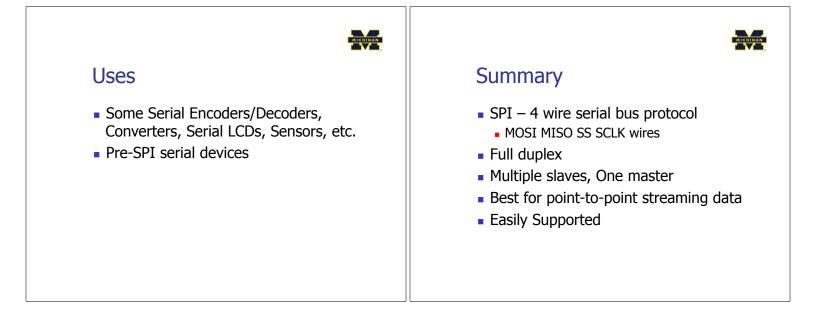

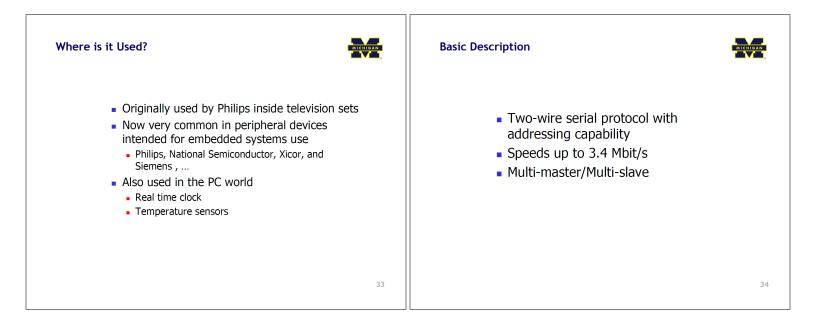

## Clock Phase (Advanced)

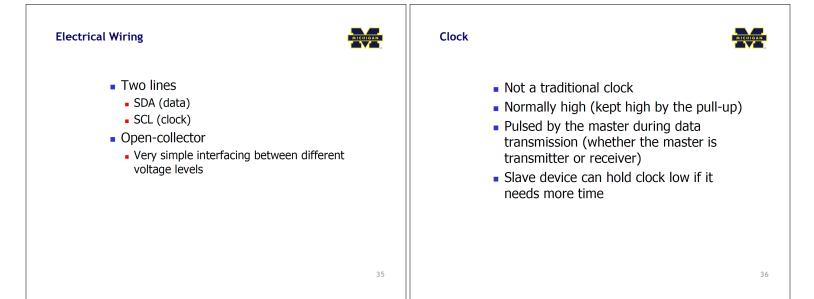

- Two phases and two polarities of clock
- Four modes
- Master and selected slave must be in same mode
- Master must change polarity and phase to communicate with slaves of different numbers

## Exercise: Bus bit rate vs Useful data rate

- An I2C "transactions" involves the following bits - <S><A6:A0><R/W><A><D7:D0><A><F>
- Which of these actually carries useful data?
   <S><A6:A0><R/W><A><D7:D0><A><F>
- So, if a bus runs at 400 kHz
- What is the clock period?
  - What is the data throughput (i.e. data-bits/second)?
  - What is the bus "efficiency"?
