Time to discuss the progress!
Project progress report
- The project progress report is expected to cover the following aspects:
  1. What changes you have made for the task compared to the proposal, including problem/task, models, datasets, or evaluation methods? If there is any change, please explain why.
  2. Describe data preprocessing process. This includes data cleaning, selection, feature generation or other representation you have used, etc. Justify the decisions you’ve made, e.g. the reasons behind using a certain dataset or building a new dataset.
  3. What methods or models you have tried towards the project goal? And why do you choose the methods (you can include related work on similar tasks or relevant tasks)? Justify the usage of a model or a certain method you choose.
  4. What results you have achieved up to now based on your proposed evaluation methods? What worked and what didn’t work? Try to explain why something didn’t work as expected.
  5. How can you improve your models? What are the next steps?
Grading: For 2-5, each aspect will take 25 points.
Length: 2 page (or more if necessary). Single space if MS word is used. Or you can choose latex templates, e.g. https://www.acm.org/publications/proceedings-template.
Feel free to reach out to instructors for discussions!

Sparse versus dense vectors
- PPMI vectors are
  - long (length |V|= 20,000 to 50,000)
  - sparse (most elements are zero)
- Alternative: learn vectors which are
  - short (length 200-1000)
  - dense (most elements are non-zero)

Why dense vectors?
- Short vectors may be easier to use as features in machine learning (less weights to tune)
- Dense vectors may generalize better than storing explicit counts
- They may do better at capturing synonymy:
  - car and automobile are synonyms; but are represented as distinct dimensions; this fails to capture similarity between a word with car as a neighbor and a word with automobile as a neighbor

Outline
- Neural language models with skip-grams (Word2vec)
  - Task, training algorithm, training data construction, training objective
- Properties of embeddings
- Embeddings and bias

Neural language models
- Skip-grams
- Continuous Bag of Words (CBOW)
Neural language models

- Skip-grams
- Continuous Bag of Words (CBOW)

Prediction-based models to get dense vectors

- Skip-gram (Mikolov et al. 2013a), CBOW (Mikolov et al. 2013b)
- Idea: Learn embeddings as part of the process of word prediction
- Implementation: Train a neural network to predict neighboring words
- Advantages:
  - Fast, easy to train
  - Available online in the word2vec package
  - Including sets of pretrained embeddings

Word2Vec: Skip-Gram Task

- Given a sentence: lemon, a tablespoon of apricot jam a pinch ...
- Instead of counting how often each word w occurs near "apricot"
- Train a classifier on a binary prediction task:
  - Is w likely to show up near "apricot"?
- We don't actually care about this task
  - But we'll take the learned weights (will be discussed later) as the word embeddings

Brilliant insight: Use running text as implicitly supervised training data!

- A word near apricot
  - Acts as gold 'correct answer' to the question
  - "Is word w likely to show up near apricot?"
- No need for hand-labeled supervision
  - The idea comes from neural language modeling
    - Bengio et al. (2003)
    - Collobert et al. (2011)

Word2Vec: Skip-Gram Task

- Now we have positive samples.
- Where do the "negative samples" come from?

Skip-gram algorithm

1. Treat the target word and a neighboring context word as positive examples.
2. Randomly sample other words in the vocabulary to get negative samples
3. Use logistic regression to train a classifier to distinguish those two cases
4. Use the weights as the embeddings
Turning dot product into a probability

• The sigmoid lies between 0 and 1:

\[
\sigma(x) = \frac{1}{1 + e^{-x}}
\]

How to compute \( p(+) | t, c \)?

• Intuition:
  • Words are likely to appear near similar words
  • Model similarity with dot-product!
  • Similarity(t,c) \propto t \cdot c

• Problem:
  • Dot product is not a probability!
    • (Neither cosine)

Turning dot product into a probability

\[
P(+|t, c) = \frac{1}{1 + e^{-t \cdot c}}
\]

\[
P(-|t, c) = 1 - P(+|t, c) = \frac{e^{-t \cdot c}}{1 + e^{-t \cdot c}}
\]

Skip-gram Goal

• Given a tuple \((t, c)\) = target, context
  • \((apricot, jam)\) -> +
  • \((apricot, aardvark)\) -> -

• Return probability that \( c \) is a real context word (or not):
  • \( P(+|t, c) \) -> positive
  • \( P(-|t, c) = 1 - P(+|t, c) \) -> negative

Skip-gram Training Data

• Training sentence:
  ... lemon, \textbf{a tablespoon} of apricot jam \textbf{a pinch} ...

\( c_1 \ c_2 \ \text{target} \ c_3 \ c_4 \)

Assume context words are those in +/- 2 word window
For all the context words:

- Assume all context words are independent

\[
P(+t, c_1:k) = \prod_{i=1}^{k} \frac{1}{1 + e^{-r_{ci}}}
\]

\[
\log P(+t, c_1:k) = \sum_{i=1}^{k} \log \frac{1}{1 + e^{-r_{ci}}}
\]

---

**Skip-gram Training Data**

- Training sentence:
  
  ... lemon, a tablespoon of apricot jam a pinch ...

  \[\text{c1 c2 t c3 c4}\]

- Training data: input/output pairs centering on apricot
- Assume a +/- 2 word window

---

**Skip-gram Training Data**

- Training sentence:
  
  ... lemon, a tablespoon of apricot jam a pinch ...

  \[\text{c1 c2 t c3 c4}\]

- Training data: input/output pairs centering on apricot
- Assume a +/- 2 word window

---

**Skip-gram Training Data**

- Training sentence:
  
  ... lemon, a tablespoon of apricot jam a pinch ...

  \[\text{c1 c2 t c3 c4}\]

- Training data: input/output pairs centering on apricot
- Assume a +/- 2 word window

---

**Skip-gram Training Data**

- Training sentence:
  
  ... lemon, a tablespoon of apricot jam a pinch ...

  \[\text{c1 c2 t c3 c4}\]

- Training data: input/output pairs centering on apricot
- Assume a +/- 2 word window

---

**Skip-gram Training Data**

- Training sentence:
  
  ... lemon, a tablespoon of apricot jam a pinch ...

  \[\text{c1 c2 t c3 c4}\]

- Training data: input/output pairs centering on apricot
- Assume a +/- 2 word window

---

**Skip-gram Training Data**

- Training sentence:
  
  ... lemon, a tablespoon of apricot jam a pinch ...

  \[\text{c1 c2 t c3 c4}\]

- Training data: input/output pairs centering on apricot
- Assume a +/- 2 word window

---

**Skip-gram Training Data**

- Training sentence:
  
  ... lemon, a tablespoon of apricot jam a pinch ...

  \[\text{c1 c2 t c3 c4}\]

- Training data: input/output pairs centering on apricot
- Assume a +/- 2 word window

---

**Skip-gram Training Data**

- Training sentence:
  
  ... lemon, a tablespoon of apricot jam a pinch ...

  \[\text{c1 c2 t c3 c4}\]

- Training data: input/output pairs centering on apricot
- Assume a +/- 2 word window
Setup

- Let's represent words as vectors of some length (say 300), randomly initialized.
- So we start with 300 * V random parameters
- Over the entire training set, we'd like to adjust those word vectors such that we
  - Maximize the similarity of the target word, context word pairs (t,c) drawn from the positive data
  - Minimize the similarity of the (t,c) pairs drawn from the negative data

Formally

- We want to maximize the following objective
  \[ \sum_{(t,c) \in +} \log P(+|t,c) + \sum_{(t,c) \in -} \log P(-|t,c) \]
- Maximize the + label for the pairs from the positive training data, and the - label for the pairs sampled from the negative data.

Focusing on one target word t:

\[
L(\theta) = \log P(+|t,c) + \sum_{i=1}^{k} \log P(-|n_i, t)
\]
\[
= \log \sigma(c \cdot t) + \sum_{i=1}^{k} \log \sigma(-n_i \cdot t)
\]
\[
= \log \frac{1}{1 + e^{-c \cdot t}} + \sum_{i=1}^{k} \log \frac{1}{1 + e^{n_i \cdot t}}
\]

Logistic regression

Train using gradient descent

- Idea: gradually changing W and C
- Finally learns two separate embedding matrices W and C
- Can use W and throw away C, or merge them

Summary: How to learn skip-gram embeddings

- Start with V random 300-dimensional vectors as initial embeddings
- Use logistic regression, the second most basic classifier used in machine learning after naive bayes
  - Take a corpus and take pairs of words that co-occur as positive examples
  - Take pairs of words that don’t co-occur as negative examples
  - Train the classifier to distinguish these by slowly adjusting all the embeddings to improve the classifier performance
  - Throw away the classifier code and keep the embeddings.

Outline

- Neural language models with skip-grams (Word2vec)
  - Task, training algorithm, training data construction, training objective
- Properties of embeddings
- Embeddings and bias

Properties of embeddings

- Nearest words to some embeddings (Mikolov et al. 2013)

<table>
<thead>
<tr>
<th>Target</th>
<th>Redmond</th>
<th>Warsaw</th>
<th>zaporoz</th>
<th>gramine</th>
<th>capitulate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Redmond</td>
<td>president</td>
<td>Vaclav Havel</td>
<td>martial arts</td>
<td>gramine</td>
<td>capitulated</td>
</tr>
<tr>
<td>Microsoft</td>
<td>Velvet Revolution</td>
<td>overmanship</td>
<td>bagmen</td>
<td>capitulate</td>
<td></td>
</tr>
</tbody>
</table>

Properties of embeddings

- Similarity depends on window size $C$
  - $C = \pm 2$ The nearest words to Hogwarts:
    - Sunnydale
    - Evernight
  - $C = \pm 5$ The nearest words to Hogwarts:
    - Dumbledore
    - Malfoy
    - halfblood

Evaluating embeddings

- Compare to human scores on word similarity-type tasks:
  - WordSim-353 (Finkelstein et al., 2002)
  - Stanford Contextual Word Similarity (SCWS) dataset (Huang et al., 2012)
  - TOEFL dataset:
    - Levied is closest in meaning to:
    - imposed, believed, requested, correlated

Analogy: Embeddings capture relational meaning!

- $\text{vector('king')} - \text{vector('man')} + \text{vector('woman')} = \text{vector('queen')}$
- $\text{vector('Paris')} - \text{vector('France')} + \text{vector('Italy')} = \text{vector('Rome')}$
Embeddings can help study word history!

- Train embeddings on old books to study changes in word meaning!!

Visualizing changes

Project 300 dimensions down into 2

The evolution of sentiment words

Negative words change faster than positive words
Outline

- Neural language models with skip-grams (Word2vec)
  - Task, training algorithm, training data construction, training objective
- Properties of embeddings
  - Embeddings and bias

Embeddings reflect cultural bias

- Ask “Paris : France :: Tokyo : x”
  - x = Japan
- Ask “father : doctor :: mother : x”
  - x = nurse
- Ask “man : computer programmer :: woman : x”
  - x = homemaker

Embeddings reflect cultural bias

- Implicit Association test (Greenwald et al. 1998):
  - How associated are concepts (flowers, insects) & attributes (pleasantness, unpleasantness)?
  - Studied by measuring timing latencies for categorization.
- Psychological findings on US participants:
  - African-American names are associated with unpleasant words (more than European-American names)
  - Male names associated more with math, female names with arts
  - Old people’s names with unpleasant words, young people with pleasant words.

Embeddings as a window onto history

- The cosine similarity of embeddings for decade X for occupations or adjectives (e.g. teacher or smart) to male vs female names
  - Find its correlation with the actual percentage of women teachers in decade X

History of biased framings of women

- Embeddings for competence adjectives are biased toward men
  - Smart, wise, brilliant, intelligent, resourceful, thoughtful, logical, etc.
  - This bias is slowly decreasing
Embeddings reflect ethnic stereotypes over time

- Princeton trilogy experiments
- Attitudes toward ethnic groups (1933, 1951, 1969) scores for adjectives
  - industrious, superstitious, nationalistic, etc
- Cosine of Chinese name embeddings with those adjective embeddings correlates with human ratings.

Changes in linguistic framing 1910-1990

Change in association of Chinese names with adjectives framed as “othering” (barbaric, monstrous, bizarre)

Directions

- Debiasing algorithms for embeddings
- Use embeddings as a historical tool to study bias

Changes in framing: adjectives associated with Chinese
