## One-Slide Summary

- A type environment gives types for free variables. You typecheck a let-body with an environment that has been updated to contain the new let-variable.
- If an object of type $X$ could be used when one of type $Y$ is acceptable then we say $X$ is a subtype of Y , also written $\mathrm{X} \leq \mathrm{Y}$.
- A type system is sound if $\forall \mathrm{E}$. dynamic_type(E) $\leq$ static_type(E)

## Lecture Outline

- Typing Rules
- Typing Environments
- "Let" Rules
- Subtyping
- Wrong Rules

## Example: $1+2$

If we can prove it, then it's true!

## Soundness

- A type system is sound if
- Whenever $\vdash \mathrm{e}: \mathrm{T}$
- Then e evaluates to a value of type $T$
- We only want sound rules
- But some sound rules are better than others:
( i is an integer)
$\vdash$ i : Object

SPEAKERS DOWN. NOW FLIP THAT RED SWITCH.

SHIRLEY SHIRIEY

## Type Checking Proofs

- Type checking proves facts e: T
- One type rule is used for each kind of expression
- In the type rule used for a node e
- The hypotheses are the proofs of types of e's subexpressions
- The conclusion is the proof of type of e itself

## Rules for Constants

## $\overline{\vdash \text { false : Bool }}$ [Bool]

-s String [String]
$\vdash \mathrm{s}$ : String
(s is a string constant)

## Rule for New

new T produces an object of type T

- Ignore SELF_TYPE for now . . .

## Two More Rules

$$
\frac{\vdash \mathrm{e}: \text { Bool }}{\vdash \text { not e }: \text { Sol }}[\mathrm{Not}]
$$

$$
\vdash \mathrm{e}_{1}: \text { Boob }
$$

$$
\vdash e_{2}: T
$$

$\vdash$ while $\mathrm{e}_{1}$ loop e $\mathrm{e}_{2}$ pool : Object

## Typing: Example

- Typing for while not false loop $1+2$ * 3 pool

## Typing: Example

- Typing for while not false loop $1+2$ * 3 pool

## Typing: Example

- Typing for while not false loop $1+2$ * 3 pool

## Typing: Example

- Typing for while not false loop $1+2$ * 3 pool

## Typing: Example

- Typing for while not false loop $1+2$ * 3 pool

## Typing: Example

- Typing for while not false loop $1+2$ * 3 pool

## Typing: Example

- Typing for while not false loop $1+2$ * 3 pool

## Typing: Example

- Typing for while not false loop $1+2$ * 3 pool

## Typing: Example

- Typing for while not false loop $1+2$ * 3 pool

## Typing: Example

- Typing for while not false loop $1+2$ * 3 pool

## Typing: Example

- Typing for while not false loop $1+2$ * 3 pool

## Typing: Example

- Typing for while not false loop $1+2$ * 3 pool

## Typing: Example

- Typing for while not false loop $1+2$ * 3 pool

## Typing Derivations

- The typing reasoning can be expressed as a tree:
$\frac{\vdash \text { false : Bool }}{\vdash \text { not false : Bool }} \frac{\vdash 1: \operatorname{lnt} \frac{\vdash 2: \operatorname{lnt} \vdash 3: \operatorname{lnt}}{\vdash 2^{*} 3: \operatorname{lnt}}}{\vdash 1+2 * 3: \operatorname{lnt}}$
$\vdash$ while not false loop $1+2$ * 3 : Object
- The root of the tree is the whole expression
- Each node is an instance of a typing rule
- Leaves are the rules with no hypotheses

## A Problem

- What is the type of a variable reference?

- The local structural rule does not carry enough information to give $x$ a type. Fail.

# A Solution: Put more information in the rules! 

- A type environment gives types for free variables
- A type environment is a mapping from Object_Identifiers to Types
- A variable is free in an expression if:
- The expression contains an occurrence of the variable that refers to a declaration outside the expression
- in the expression " $x$ ", the variable " $x$ " is free
- in "let $x$ : Int in $x+y$ " only " $y$ " is free
- in " $\underline{x}+$ let $x$ : Int in $x+\underline{y}$ " both " $\underline{x}$ ", " $\underline{y}$ " are free

## Type Environments

Let O be a function from Object_Identifiers to Types

The sentence $O \vdash \mathrm{e}: \mathrm{T}$
is read: Under the assumption that variables have the types given by 0 , it is provable that the expression e has the type $T$

## Modified Rules

The type environment is added to the earlier rules:

$$
\begin{aligned}
& \frac{\mathrm{O} \vdash \mathrm{i}: \text { Int }}{[\text { Int }]} \text { ( } \mathrm{i} \text { is an integer) } \\
& \mathrm{O} \vdash \mathrm{e}_{1}: \text { Int } \\
& \mathrm{O} \vdash \mathrm{e}_{2}: \text { Int } \\
& \mathrm{O} \vdash \mathrm{e}_{1}+\mathrm{e}_{2}: \text { Int }
\end{aligned}
$$

## New Rules

And we can write new rules:

Equivalently:

$$
\frac{O(x)=T}{O \vdash x: T} \quad[\operatorname{Var}]
$$

## Let

$\frac{O\left[T_{0} / x\right] \vdash e_{1}: T_{1}}{O \vdash \text { let } x: T_{0} \text { in } e_{1}: T_{1}}$

## [Let-No-Init]

$\mathrm{O}\left[\mathrm{T}_{0} / \mathrm{x}\right]$ means " $O$ modified to map $x$ to $T_{0}$ and behaving as 0 on all other arguments":

$$
\begin{aligned}
& \mathrm{O}\left[\mathrm{~T}_{0} / \mathrm{x}\right](\mathrm{x})=\mathrm{T}_{0} \\
& \mathrm{O}\left[\mathrm{~T}_{0} / \mathrm{x}\right](\mathrm{y})=\mathrm{O}(\mathrm{y})
\end{aligned}
$$

(You can write $O\left[x / T_{0}\right]$ on tests/assignments. $)_{30}$

## Let Example

- Consider the Cool expression
let $\mathrm{x}: \mathrm{T}_{0}$ in (let $\mathrm{y}: \mathrm{T}_{1}$ in $\mathrm{E}_{\mathrm{x}, \mathrm{y}}$ ) $+\left(\right.$ let $\mathrm{x}: \mathrm{T}_{2}$ in $\mathrm{F}_{\mathrm{x}, \mathrm{y}}$ )
(where $E_{x, y}$ and $F_{x, y}$ are some Cool expression that contain occurrences of " $x$ " and " $y$ ")
- Scope
- of " $y$ " is $E_{x, y}$
- of outer " $x$ " is $E_{x, y}$
- of inner " $x$ " is $F_{x, y}$
- This is captured precisely in the typing rule.

$\left(O\left[T_{0} / x\right]\right)\left[T_{1} / y\right] \vdash x: T_{0}$

## Notes

- The type environment gives types to the free identifiers in the current scope
- The type environment is passed down the AST from the root towards the leaves
- Types are computed up the AST from the leaves towards the root

## Q: Movies (362 / 842)

- In this 1992 comedy Dana Carvey and Mike Myers reprise a Saturday Night Live skit, sing Bohemian Rhapsody and say of a guitar: "Oh yes, it will be mine."
Q: General (455 / 842)
- This numerical technique for finding solutions to boundary-value problems was initially developed for use in structural analysis in the 1940's. The subject is represented by a model consisting of a number of linked simplified representations of discrete regions. It is often used to determine stress and displacement in mechanical systems.

## Q: Movies (377 / 842)

- Identify the subject or the speaker in 2 of the following 3 Star Wars quotes.
- "Aren't you a little short to be a stormtrooper?"
- "I felt a great disturbance in the Force ... as if millions of voices suddenly cried out in terror and were suddenly silenced."
- "I recognized your foul stench when I was brought on board."

## Let with Initialization

Now consider let with initialization:

$$
\begin{gathered}
\mathrm{O} \vdash \mathrm{e}_{0}: \mathrm{T}_{0} \\
\mathrm{O}\left[\mathrm{~T}_{0} / \mathrm{x}\right] \vdash \mathrm{e}_{1}: \mathrm{T}_{1}
\end{gathered}
$$

[Let-Init]
$0 \vdash$ let $x: T_{0} \leftarrow e_{0}$ in $e_{1}: T_{1}$

This rule is weak. Why?

## Let with Initialization

- Consider the example:

$$
\begin{aligned}
& \text { class } C \text { inherits } P\{\ldots\} \\
& \text { l.. } \\
& \text { let } x: P \leftarrow \text { new } C \text { in ... }
\end{aligned}
$$

- The previous let rule does not allow this code
- We say that the rule is too weak or incomplete

## Subtyping

- Define a relation $X \leq Y$ on classes to say that:
- An object of type $X$ could be used when one of type $Y$ is acceptable, or equivalently
- X conforms with Y
- In Cool this means that $X$ is a subclass of $Y$
- Define a relation $\leq$ on classes
$X \leq X$
$X \leq Y$ if $X$ inherits from $Y$
$X \leq Z$ if $X \leq Y$ and $Y \leq Z$

## Let With Initialization (Better)

$$
\begin{gathered}
\mathrm{O} \vdash \mathrm{e}_{0}: \mathrm{T} \\
\mathrm{~T} \leq \mathrm{T}_{0} \\
\mathrm{O}\left[\mathrm{~T}_{0} / \mathrm{x}\right] \vdash \mathrm{e}_{1}: \mathrm{T}_{1} \quad \text { [Let-Init] }
\end{gathered}
$$

$0 \vdash$ let $x: T_{0} \leftarrow e_{0}$ in $e_{1}: T_{1}$

- Both rules for let are sound
- But more programs type check with this new rule (it is more complete)

## Type System Tug-of-War

- There is a tension between
- Flexible rules that do not constrain programming
- Restrictive rules that ensure safety of execution

# Expressiveness of Static Type Systems 

- A static type system enables a compiler to detect many common programming errors
- The cost is that some correct programs are disallowed
- Some argue for dynamic type checking instead
- Others argue for more expressive static type checking
- But more expressive type systems are also more complex

## Dynamic And Static Types

- The dynamic type of an object is the class C that is used in the "new C" expression that creates the object
- A run-time notion
- Even languages that are not statically typed have the notion of dynamic type
- The static type of an expression is a notation that captures all possible dynamic types the expression could take
- A compile-time notion

## Dynamic and Static Types. (Cont.)

- In early type systems the set of static types correspond directly with the dynamic types
- Soundness theorem: for all expressions E dynamic_type(E) = static_type(E)
(in all executions, E evaluates to values of the type inferred by the compiler)
- This gets more complicated in advanced type systems (e.g., Java, Cool)

## Dynamic and Static Types in COOL

- A variable of static type A can hold values of static type $B$, if $B \leq A$

## Dynamic and Static Types

## Soundness theorem for the Cool type system:

$\forall$ E. dynamic_type(E) $\leq$ static_type(E)
Why is this Ok?

- For E, compiler uses static_type(E)
- All operations that can be used on an object of type C can also be used on an object of type C' $\leq \mathrm{C}$
- Such as fetching the value of an attribute
- Or invoking a method on the object
- Subclasses can only add attributes or methods
- Methods can be redefined but with the same types!

## Subtyping Example

- Consider the following Cool class definitions

Class A \{a(): int \{ 0 \}; \}<br>Class B inherits A $\{b():$ int $\{1\} ;\}$

- An instance of B has methods "a" and "b"
- An instance of A has method "a"
- A type error occurs if we try to invoke method "b" on an instance of A

## Example of Wrong Let Rule (1)

- Now consider a hypothetical wrong let rule:

$$
\frac{0 \vdash e_{0}: T \quad T \leq T_{0} \quad 0 \vdash e_{1}: T_{1}}{0 \vdash \text { let } x: T_{0} \leftarrow e_{0} \text { in } e_{1}: T_{1}}
$$

- How is it different from the correct rule?

## Example of Wrong Let Rule (1)

- Now consider a hypothetical wrong let rule:

$$
\frac{0 \vdash e_{0}: T \quad T \leq T_{0} \quad 0 \vdash e_{1}: T_{1}}{0 \vdash \text { let } x: T_{0} \leftarrow e_{0} \text { in } e_{1}: T_{1}}
$$

- How is it different from the correct rule?
- The following good program does not typecheck let $x$ : Int $\leftarrow 0$ in $x+1$
-Why?

## Example of Wrong Let Rule (2)

- Now consider a hypothetical wrong let rule:
$O \vdash e_{0}: T \quad T_{0} \leq T \quad O\left[T_{0} / x\right] \vdash e_{1}: T_{1}$
$O \vdash$ let $x: T_{0} \leftarrow e_{0}$ in $e_{1}: T_{1}$
- How is it different from the correct rule?

## Example of Wrong Let Rule (2)

- Now consider a hypothetical wrong let rule:

$$
\frac{0 \vdash e_{0}: T \quad T_{0} \leq T \quad O\left[T_{0} / x\right] \vdash e_{1}: T_{1}}{0 \vdash \text { let } x: T_{0} \leftarrow e_{0} \text { in } e_{1}: T_{1}}
$$

- How is it different from the correct rule?
- The following bad program is well typed

$$
\text { let } x: B \leftarrow \text { new } A \text { in } x . b()
$$

-Why is this program bad?

## Example of Wrong Let Rule (3)

- Now consider a hypothetical wrong let rule:

$$
\frac{O \vdash e_{0}: T \quad T \leq T_{0} \quad O[T / x] \vdash e_{1}: T_{1}}{O \vdash \text { let } x: T_{0} \leftarrow e_{0} \text { in } e_{1}: T_{1}}
$$

- How is it different from the correct rule?

## Example of Wrong Let Rule (3)

- Now consider a hypothetical wrong let rule:

$$
\frac{O \vdash e_{0}: T \quad T \leq T_{0} O[T / x] \vdash e_{1}: T_{1}}{O \vdash \text { let } x: T_{0} \leftarrow e_{0} \text { in } e_{1}: T_{1}}
$$

- How is it different from the correct rule?
- The following good program is not well typed let $x: A \leftarrow$ new $B$ in $\{\ldots x \leftarrow$ new $A ; x . a() ;\}$
- Why is this program not well typed?

## Typing Rule Notation

- The typing rules use very concise notation
- They are very carefully constructed
- Virtually any change in a rule either:
- Makes the type system unsound
(bad programs are accepted as well typed)
- Or, makes the type system less usable (incomplete) (good programs are rejected)
- But some good programs will be rejected anyway
- The notion of a good program is undecidable

## Assignment

More uses of subtyping:

$$
\begin{gathered}
\mathrm{O}(\mathrm{id})=\mathrm{T}_{0} \\
\mathrm{O} \vdash \mathrm{e}_{1}: \mathrm{T}_{1} \\
\mathrm{~T}_{1} \leq \mathrm{T}_{0} \\
\mathrm{O} \vdash \mathrm{id} \leftarrow \mathrm{e}_{1}: \mathrm{T}_{1}
\end{gathered}
$$

[Assign]

## Initialized Attributes

- Let $\mathrm{O}_{\mathrm{C}}(\mathrm{x})=\mathrm{T}$ for all attributes $\mathrm{x}: \mathrm{T}$ in class C
- $\mathrm{O}_{\mathrm{c}}$ represents the class-wide scope
- Attribute initialization is similar to let, except for the scope of names

$$
\begin{gathered}
\mathrm{O}_{\mathrm{C}}(\mathrm{id})=\mathrm{T}_{0} \\
\mathrm{O}_{\mathrm{C}} \vdash \mathrm{e}_{1}: \mathrm{T}_{1} \\
\mathrm{~T}_{1} \leq \mathrm{T}_{0} \\
\mathrm{O}_{\mathrm{C}} \vdash \mathrm{id}: \mathrm{T}_{0} \leftarrow \mathrm{e}_{1} ;
\end{gathered} \text { [Attr-Init] } \quad \text { [ }
$$

## If-Then-Else

- Consider:
if $e_{0}$ then $e_{1}$ else $e_{2} f i$
- The result can be either $e_{1}$ or $e_{2}$
- The dynamic type is either $\mathrm{e}_{1}$ 's or $\mathrm{e}_{2}$ 's type
- The best we can do statically is the smallest supertype larger than the type of $\mathrm{e}_{1}$ and $\mathrm{e}_{2}$

## If-Then-Else example

- Consider the class hierarchy

- ... and the expression
if ... then new $A$ else new $B$ fi
- Its type should allow for the dynamic type to be both A or B
- Smallest supertype is $P$

## Least Upper Bounds

- Define: lub $(X, Y)$ to be the least upper bound of $X$ and $Y$. lub $(X, Y)$ is $Z$ if
- $\mathrm{X} \leq \mathrm{Z} \wedge \mathrm{Y} \leq \mathrm{Z}$
$Z$ is an upper bound
$-\mathrm{X} \leq \mathrm{Z}^{\prime} \wedge \mathrm{Y} \leq \mathrm{Z}^{\prime} \Rightarrow \mathrm{Z} \leq \mathrm{Z}^{\prime}$
$Z$ is least among upper bounds
- In Cool, the least upper bound of two types is their least common ancestor in the inheritance tree

## If-Then-Else Revisited

$$
\begin{gathered}
\mathrm{O} \vdash \mathrm{e}_{0}: \text { Bool } \\
\mathrm{O} \vdash \mathrm{e}_{1}: \mathrm{T}_{1} \\
\mathrm{O} \vdash \mathrm{e}_{2}: \mathrm{T}_{2}
\end{gathered}
$$

$0 \vdash$ if $e_{0}$ then $e_{1}$ else $e_{2}$ fi: $\operatorname{lub}\left(T_{1}, T_{2}\right)$
[If-Then-Else]

## Case

- The rule for case expressions takes a lub over all branches

$$
\begin{gathered}
0 \vdash \mathrm{e}_{0}: \mathrm{T}_{0} \\
\mathrm{O}\left[\mathrm{~T}_{1} / \mathrm{x}_{1}\right] \vdash \mathrm{e}_{1}: \mathrm{T}_{1}^{\prime} \quad \text { [Case] } \\
\ldots \\
\mathrm{O}\left[\mathrm{~T}_{\mathrm{n}} / \mathrm{x}_{\mathrm{n}}\right] \vdash \mathrm{e}_{\mathrm{n}}: \mathrm{T}_{\mathrm{n}}^{\prime}
\end{gathered}
$$

O $\vdash$ case $e_{0}$ of $x_{1}: T_{1} \Rightarrow e_{1}$; $\ldots ; x_{n}: T_{n} \Rightarrow e_{n} ; \operatorname{esac}: \operatorname{lub}\left(T_{1}{ }^{\prime}, \ldots, T_{n}{ }^{\prime}\right)$

## Next Time (Post-Midterm)

- Type checking method dispatch
- Type checking with SELF_TYPE in COOL

## Homework

- Today: WA3 due
- Wednesday: PA3 due
- Parsing!
- Thursday Feb 28 - Midterm 1 in Class
- 2:05-3:15
- One page of notes (front and back) hand-written by you
- Before Next Tuesday: Read Chapter 7.2
