

## Outline

- Names and Places
- set! and friends
- Environment Model
- Golden Ages
- There will not be normally scheduled lab hours or office hours over spring break.
- If you are interested in tutoring, email cs1120-staff@cs.virginia.edu for more information!

## One-Slide Summary

- The substitution model for evaluating Scheme does not allow us to reason about mutation. In the environment model:
- A name is a place for storing a value. define, cons and function application create places. set! changes the value in a place.
- Places live in frames. An environment is a frame and a pointer to a parent frame. The global environment has no parent.
- To evaluate a name, walk up the frames until you find a definition.
- A golden age is a period when knowledge or quality increases rapidly.

## Reading Quiz

- Write your UVA ID on a piece of paper.
- In the Neil deGrass Tyson essay The Invisible Future (assigned reading before today's class), the author focuses primarily on one law. Name it. (Note that multiple laws are mentioned, but one is at the heart of the matter.)

From Lecture 3:

## Evaluation Rule 2: Names

If the expression is a name, it evaluates to the value associated with that name.
$>$ (define two 2 )
$>$ two
2
This is called the substitution model. You can reason about Scheme expressions by substituting the definition in whenever it is used.

## Names and Places

- A name is not just a value, it is a place for storing a value.
- define creates a new place, associates a name with that place, and stores a value in that place
(define x 3)
x: 3

## Bang!

set! ("set bang") changes the value associated with a place
$>$ (define $\times 3$ )
$>$ X
3
$>$ (set! x 7)
$>x$
7
x: 7
set! should make you nervous

```
> (define x 2)
> (nextx)
3
> (nextx)
4
>
4
```

Before set! all procedures were pure functions (except for some with side-effects). The value of (f) was the same every time you evaluated it. Now it might be different!

## Defining nextx

(define (nextx)
(set! $x(+x$ 1))
x)

## Evaluation Rules

$>$ (define x 3 )
$>$ (+ (nextx) $x$ )
7
or 8
$>(+x(n e x t x))$
(9)
or 10

DrScheme evaluates application subexpressions left to right, but Scheme evaluation rules allow any order.

## Evaluation Rules <br> Evaluation Rules

$>($ define $\times 3)$
$>(+($ nextx $) x)$
7
or 8
$>(+x($ nextx $))$
9
or 10
$>$ (define pair (cons 12 ))
> pair
(1.2)
$>$ (define pair (cons 12 ))
> pair
(1. 2)
$>$ (set-car! pair 0)
$>$ (car pair)
0
> (cdr pair)
2
$>$ (set-cdr! pair 1)
> pair
(0.1)

$>$ (define pair (cons 12 ))
> pair
(1.2)
$>$ (set-car! pair 0 )
> (car pair)
0
> (cdr pair)
2

## Mutation Changes Everything!

- We can no longer talk about the "value of an expression"
- The value of a give expression can change!
- We need to talk about "the value of an expression in an execution environment"
- "execution environment" = "context so far"
- The order in which expressions are evaluated now matters

## Why Substitution Fails

$>$ (define (nextx) (set! x (+ x 1)) x )
$>$ (define $\times 0$ )
$>(($ lambda $(\mathrm{x})(+\mathrm{xx}))($ nextx $))$
2
Substitution model for evaluation would predict:
(+ (nextx) (nextx))
$(+($ begin $(\operatorname{set}!x(+x 1)) x)($ begin $($ set $x(+x 1)) x))$
$(+($ begin $($ set! $0(+01)) 0)(b e g i n($ set! $0(+01)) 0))$
(+ 00 )
0

## Liberal Arts Trivia: Astrophysics

- According to this 1915 theory (be specific), the observed gravitational attraction between masses results from the warping of space and time by those masses. This theory helps to explain observed phenomena, such as anomalies in the orbit of Mercury, that are not predicted by Newton's Laws, and can deal with accelerated reference frames. It is part of the framework of the standard Big Bang model of Cosmology.

## Very Scary!

- The old substitution model does not explain Scheme programs that contain mutation.
- We need a new environment model.

## Liberal Arts Trivia: Rhetoric

- This type of "values" debate traditionally places a heavy emphasis on logic, ethical values and philosophy. It is a one-on-one debate practiced in National Forensic League competitions. The format was named for the series of seven debates in 1858 for the Illinois seat in the United State Senate.

## Names and Places

- A name is a place for storing a value.
- define creates a new place
- cons creates two new places, the car and the cdr
- (set! name expr) changes the value in the place name to the value of expr
- (set-car! pair expr) changes the value in the car place of pair to the value of expr

## Lambda and Places

- (lambda (x) ...) also creates a new place named $x$
- The passed argument is put in that place

Environments

The global environment points to the outermost frame. It starts with all Scheme primitives.

## Location, Location, Location

- Places live in frames
- An environment is a frame and a pointer to a parent environment
- All environments except the global environment have exactly one parent environment, global environment has no parent
- Application creates a new environment

## Evaluation Rule 2: Names

A name expression evaluates to the value associated with that name.
To find the value associated with a name, look for the name in the frame associated with the evaluation environment. If it contains a place with that name, the value of the name expression is the value in that place. If it doesn't, the value of the name expression is the value of the name expression evaluated in the parent environment if the current environment has a parent. Otherwise, the name expression evaluates to an error (the name is not defined).

## Environments

The global environment points to the outermost frame. It starts with all Scheme primitives.
$>$ (define $\times 3$ )
$>$
\#27

$>$ (define $\times 3$ )
$>$ (define double (lambda $(x)(+x x))$ )
$>$

## How to Draw a Procedure

- A procedure needs both code and an environment
- We'll see why soon
- We draw procedures like this:

Environment pointer parameters: $\mathbf{x}$ body: (+ x x )

How to Draw a Procedure (for artists only)

## Application

- Old rule: (Substitution model)

Apply Rule 2: Constructed Procedures. To apply a constructed procedure, evaluate the body of the procedure with each formal parameter replaced by the corresponding actual argument expression value.

## New Application Rule 2:

1. Construct a new environment, whose parent is the environment to which the environment pointer of the applied procedure points.
2. Create places in that frame for each parameter containing the value of the corresponding operand expression.
3. Evaluate the body in the new environment. Result is the value of the application.
4. Construct a new environment, parent is procedure's environment pointer
5. Make places in that frame with the names of each parameter, and operand values
6. Evaluate the body in the new environment

7. Construct a new environment, parent is procedure's environment pointer
8. Make places in that frame with the names of each parameter, and operand values
9. Evaluate the body in the new environment
> (define x 999)

## global <br> environment <br> 1. Construct a new

 environment, parent is procedure's environment pointer
2. Make places in that frame with the names of each parameter, and operand values
3. Evaluate the body in the new environment
> (define x 999)
$>$ (define (adder x) (lambda (y) (+ x y))))
global
environment

1. Construct a new environment, parent is procedure's environment pointer
2. Make places in that frame with the names of each parameter, and operand values
3. Evaluate the body in the new environment
> (define x 999)
> (define (adder x) (lambda (y) (+ x y))))
$>$ (define addtwo (adder 2))
4. Construct a new environment, parent is procedure's environment pointer
5. Make places in that frame with the names of each parameter, and operand values
6. Evaluate the body in the new environment
> (define x 999)
$>$ (define (adder x)
(lambda (y) (+ x y))))
$>$ (define addtwo (adder 2 ))

global
environment

7. Construct a new environment, parent is procedure's environment pointer
8. Make places in that frame with the names of each parameter, and operand values
9. Evaluate the body in the new environment
> (define x 999)
$>$ (define (adder $x$ )
(lambda (y) (+ x y))))
> (define addtwo (adder 2))
globa
environment

\#40
10. Construct a new environment, parent is procedure's environment pointer
11. Make places in that frame with the names of each parameter, and operand values
12. Evaluate the body in the new environment
> (define x 999)
$>$ (define (adder x )
(lambda (y) (+ x y))))
$>$ (define addtwo (adder 2)
$>$ (addtwo 6)

## Liberal Arts Trivia: Art History

- This was a popular international art design movement from 1925 until the 1940s, affecting the decorative arts such as architecture, interior design and industrial design, as well as the visual arts such as fashion, painting, the graphic arts and film. At the time, this style was seen as elegant, glamorous, functional and modern.

Jan Vermeer, 1670

Science's Endless Golden Age

http://www.pbs.org/wgbh/nova/sciencenow/3313/nn-video-toda-w-220.html

- This baroque keyboard instrument is the spiritual predecessor of the pianoforte. It produces a sound by plucking a string when each key is pressed, but unlike the piano it lacks responsiveness to keyboard touch and thus fails to produce notes at different dynamic levels.

## Liberal Arts Trivia: Music

## Astrophysics

- "If you're going to use your computer to simulate some phenomenon in the universe, then it only becomes interesting if you change the scale of that phenomenon by at least a factor of 10. ... For a 3D simulation, an increase by a factor of 10 in each of the three dimensions increases your volume by a factor of 1000."
- How much work is astrophysics simulation (in $\Theta$ notation)?

## Astrophysics

- "If you're going to use your computer to simulate some phenomenon in the universe, then it only becomes interesting if you change the scale of that phenomenon by at least a factor of 10. ... For a 3D simulation, an increase by a factor of 10 in each of the three dimensions increases your volume by a factor of 1000."
- How much work is astrophysics simulation (in $\Theta$ notation)?
$\Theta\left(n^{3}\right)$
When we double the size of the simulation, the work octuples! (Just like oceanography octopi simulations)

## Orders of Growth

## Astrophysics and Moore's Law

- Simulating universe is $\Theta\left(n^{3}\right)$
- Moore's law: computing power doubles every 18 months
- Dr. Tyson: to understand something new about the universe, need to scale by $10 x$
- How long does it take to know twice as much about the universe?

## Knowledge of the Universe

;,; doubling every 18 months = ~1.587 * every 12 months
(define (computing-power nyears)
(if (= nyears 0) 1
(* 1.587 (computing-power (- nyears 1)))))
;,; Simulation is $\Theta\left(n^{3}\right)$ work
(define (simulation-work scale) (* scale scale scale))
(define $(\log 10 x)(/(\log x)(\log 10))), ; ; ; \log$ is base $e$
,;" knowledge of the universe is $\log _{10}$ the scale of universe
;,; we can simulate
(define (knowledge-of-universe scale) (log10 scale))

## Knowledge of the Universe

(define (computing-power nyears)
(if (= nyears 0) 1 (* 1.587 (computing-power (- nyears 1)))))
,,;, doubling every 18 months $=\sim 1.587$ * every 12 months
(define (simulation-work scale) (* scale scale scale))
Simulation is $O\left(n^{\wedge} 3\right)$ work
(define $(\log 10 x)((\log x)(\log 10)))$
,,;; primitive log is natural (base e)
(define (knowledge-of-universe scale) (log10 scale))
,;,; knowledge of the universe is log 10 the scale of universe we can simulate
(define (find-knowledge-of-universe nyears)
(define (find-biggest-scale scale)
;,; today, can simulate size 10 universe $=1000$ work
(if (> (/ (simulation-work scale) 1000)
(computing-power nyears))
(- scale 1)
(find-biggest-scale (+ scale 1))))
(knowledge-of-universe (find-biggest-scale 1)))
> (find-knowledge-of-universe 0) 1.0
> (find-knowledge-of-universe 1) 1.041392685158225
> (find-knowledge-of-universe 2)
1.1139433523068367
> (find-knowledge-of-universe 5)
1.322219294733919
> (find-knowledge-of-universe 10)
1.6627578316815739
> (find-knowledge-of-universe 15) 2.0
$>$ (find-knowledge-of-universe 30) 3.00560944536028
$>$ (find-knowledge-of-universe 60)
5.0115366121349325
> (find-knowledge-of-universe 80)
6.348717927935257

Only two things are infinite, the universe and human stupidity, and l'm not sure about the former.

Albert Einstein

Will there be any mystery left in the Universe when you die?

## The Endless Golden Age

- Golden Age: period in which knowledge/quality of something doubles quickly
- At any point in history, half of what is known about astrophysics was discovered in the previous 15 years!
- Moore's law today, but other advances previously: telescopes, photocopiers, clocks, agriculture, etc.

## Endless/Short Golden Ages

- Endless golden age: at any point in history, the amount known is twice what was known 15 years ago
- Always exponential growth: $\Theta\left(k^{n}\right)$
$k$ is some constant, $n$ is number of years
- Short golden age: knowledge doubles during a short, "golden" period, but only improves linearly most of the time
- Usually linear growth: $\Theta(n)$ $n$ is number of years

## Computing Power 1969-2008 (in Apollo Control Computer Units)

## Computing Power 1969-1990

 (in Apollo Control Computer Units)
$\stackrel{0}{3}$

## Endless Golden Age and "Grade Inflation"

- Average student gets twice as smart and well-prepared every 15 years
- You had grade school teachers (maybe even parents) who went to college!
- If average GPA in 1980 is 2.00 what should it be today (if grading standards didn't change)?

## Grade Inflation or Deflation?

2.00
average GPA in 1980 ("gentle C"?)
better students 1980-1995
better students 1995-2010
population increase Virginia 1976: ~5.1M
Virginia 2006: ~7.6M
increase in enrollment
Students 1976: 10,330
Students 2006: 13,900
Average GPA today should be: 8.82 (but our expectations should also increase)

## The Real Golden Rule?

Why do fields like astrophysics, medicine, biology and computer science have "endless golden ages", but fields like ...

- rock n' roll (1962-1973, or whatever was popular when you were 16)
- music (1775-1825)
- philosophy (400BC-350BC?)
- art (1875-1925?)
- soccer (1950-1966)
- baseball (1925-1950?)
- movies (1920-1940?)
have short golden ages?
Think about it over the break!

## Homework

- Start PS 5 now!
- Due Wednesday after Break
- If you wait until after Break, you will probably not have enough time.
- Read Course Book 9 and 10 over Break
