## A Universal Language

## Next Class: Student Reality

- Special guests:
- Krasimira, Ethan, Briana, Michelle, Michael, and/or Claire
- They'll talk about who they are, how they became interested in CS, what they do (e.g., undergrad research, internships, real jobs).
- "Reading Quiz":
- I will record the UVA ID of everyone who asks a question Wednesday.
- Your score will be 0 or 1 (max).

## Final Project Presentations

- Save the date: 5pm Wed Dec 08
- Here in this room
- I'll provide free food (cf. your surveys)
- Attending is worth extra credit.
- And you'll see the fun projects of your fellow students.
- You must request to give a presentation.
- Requests are due Monday Dec 06.

## One-Slide Summary

- The lambda calculus is a universal, fundamental model of computation. You can view it as "the essence of Scheme". It contains terms and rules describing variables, function abstraction, and function application.
- There are two key reduction rules in the lambda calculus. Alpha reduction allows you to rename variables uniformly. Beta reduction is the essence of computation: in beta reduction, a function evaluation is equivalent to replacing all instances of the formal parameter in the function body with the actual argument.
- It is possible to encode programming concepts, such as true, false, if, numbers, plus, etc., in the lambda calculus.

## Administrivia

- I will try to grade Exam 2 rapidly.
- When I have your Exam 2 grade, I'll send out email with your "projected" course grade.
- Using the system described in the syllabus:
- Problem Sets 50 (40-70)
- Exam 1

15 (5-15)

- Exam $2 \quad 15$ (10-20)
- Final Exam 20 (15-50)
- Class Contribution $0(0-10)$
- We will then vote in class: final exam or not?

## $\lambda$-calculus

## Alonzo Church, 1940

(LISP was developed from $\lambda$-calculus, not the other way round.)

$$
\text { term }=\text { variable }
$$

term term
$\boldsymbol{\lambda}$ variable . term

## What is Calculus?

- In High School:
$d / d x x^{n}=n x^{n-1} \quad$ [Power Rule]
$d / d x(f+g)=d / d x f+d / d x g \quad$ [Sum Rule]

Calculus is a branch of mathematics that deals with limits and the differentiation and integration of functions of one or more variables...

## Surprise Liberal Arts Trivia

- This branch of mathematics involving symbolic expressions manipulated according to fixed rules takes its name from the diminutive form of calx/calcis, the latin word for rock or limestone. The diminutive word thus means "pebble": in ancient times pebbles were placed in sand and used for counting using techniques akin to those of the abacus.

## Real Definition

- A calculus is just a bunch of rules for manipulating symbols.
- People can give meaning to those symbols, but that's not part of the calculus.
- Differential calculus is a bunch of rules for manipulating symbols. There is an interpretation of those symbols corresponds with physics, slopes, etc.

## Lambda Calculus

- Rules for manipulating strings of symbols in the language:
term $=$ variable
| term term
| $\boldsymbol{\lambda}$ variable. term
- Humans can give meaning to those symbols in a way that corresponds to computations.

## Why?

- Once we have precise and formal rules for manipulating symbols, we can reason with those symbols and rules.
- Since we can interpret the symbols as representing computations, we can use this system to reason about programs.
- (It will provide additional evidence that Scheme and Turing machines have equivalent computational power.)
Evaluation Rules

| -reduction $\quad$ (renaming) |
| :---: |
| $\lambda y . M \Rightarrow_{\alpha} \lambda v .(M$ [each $y$ replaced by $\left.v]\right)$ |
| where $v$ does not occur in $M$. |
| $\beta$-reduction $\quad$ (substitution) |
| $(\lambda x . M) N \Rightarrow{ }_{\beta} M$ [each $x$ replaced by $\left.N\right]$ | We'll see examples in a bit! $_{\# \# 12}$

## Equivalent Computers?

Turing Machine
$\begin{aligned} \text { term }= & \text { variable } \\ & \mid \text { term term } \\ & \mid(\text { term }) \\ & \mid \boldsymbol{\lambda} \text { variable } . \text { term }\end{aligned}$
$\equiv$
$\lambda y \cdot M \Rightarrow_{\alpha} \lambda v .(M[y \rightarrow v])$
where $v$ does not occur in $M$.
$(\lambda x . M) N \Rightarrow{ }_{\beta} M[x \rightarrow N]$ Lambda Calculus

## Liberal Arts Trivia: Music

- This music genre originated in Jamaica in the 1950s and was the precursor to reggae. It combines elements of Caribbean mento and calypso with American jazz and rhythm and blues. It is characterized by a walking bass line accented with rhythms on the offbeat. In the 1980s it experience a third wave revival and is often associated with punk and brass instruments.

## Liberal Arts Trivia: Geography

- This baltic country borders Romania, Serbia, Macedonia, Greece, Turkey and the Black Sea. It was at one point ruled by the Ottomans, but is now a member of the EU and NATO. Sofia, the capital and largest city, is one of the oldest cities in Europe and can be traced back some 7000 years. The traditional cuisine of this country features rich salads at every meal, as well as native pastries such as the banitsa.

## Lambda Examples

## - Identity Function

- (define identity (lambda (x) x))
- identity $=\lambda x . x$
- Square Function
- (define square (lambda (x) (* $\mathrm{x} x$ ))
- square $=\lambda \times$. $\left.{ }^{*} \times x\right)$

## - Add Function

- (define (add x y) (+ x y))
- (define add (lambda (x) (lambda (y) (+ x y))))
$-\operatorname{add}=\lambda x . \lambda y .(+x y)$

## $\beta$-Reduction

(the source of all computation)
$(\lambda x . M) N \Rightarrow_{\beta} M[x \rightarrow N]$
Replace all $x$ 's in $M$ with $N$ 's

Note the syntax is different from Scheme: $(\lambda x . M) N===(($ lambda (x) M) N)

## $\beta$-Reduction Examples

- Square Function
- $\left(\lambda x .\left({ }^{*} x x\right)\right) 5$
- $\left(\lambda x .\left({ }^{*} x x\right)\right) 5 \Rightarrow_{\beta}\left(^{*} x x\right)[x \rightarrow 5]$
- $\left.\left(\lambda x .\left({ }^{*} x x\right)\right) 5 \Rightarrow_{\beta}{ }^{*} \times x\right)[x \rightarrow 5] \Rightarrow_{\beta}\left({ }^{*} 55\right)$

## - Add Function

$-\operatorname{add}=\lambda x \cdot \lambda y .(+x y)$
$-(\lambda x . \lambda y \cdot(+x y)) 3 \Rightarrow_{\beta}$ ???
$-((\lambda x . \lambda y \cdot(+x y)) 2) 6 \Rightarrow_{\beta}$ ???

## $\beta$-Reduction Examples

- Square Function

```
- square = \lambdax. (* x x)
```

- $\left(\lambda x .\left({ }^{*} x \mathrm{x}\right)\right) 5$
- $\left(\lambda x .\left({ }^{*} x x\right)\right) 5 \Rightarrow_{\beta}\left({ }^{*} x x\right)[x \rightarrow 5]$
- $\left(\lambda x .\left({ }^{*} x x\right)\right) 5 \Rightarrow_{\beta}\left(^{*} x x\right)[x \rightarrow 5] \Rightarrow_{\beta}\left({ }^{*} 55\right)$

## - Add Function

$-\operatorname{add}=\lambda \mathrm{x} \cdot \lambda \mathrm{y} .(+\mathrm{xy})$

- $(\lambda x . \lambda y .(+x y)) 3 \Rightarrow_{\beta} \lambda y .(+3 y)$
- $((\lambda x . \lambda y \cdot(+x y)) 2) 6 \Rightarrow_{\beta}(\lambda y .(+2 y)) 6 \Rightarrow_{\beta}(+2$ 6)

## Evaluating Lambda Expressions

- redex: Term of the form $(\lambda x . M) N$

Something that can be $\beta$-reduced

- An expression is in normal form if it contains no redexes (redices).
- To evaluate a lambda expression, keep doing reductions until you get to normal form.

## Some Simple Functions

$\mathbf{I} \equiv \lambda x . x$
$\mathbf{C} \equiv \lambda x y . y x$
Abbreviation for $\lambda x .(\lambda y . y x)$
$\mathbf{C I I}=(\lambda x .(\lambda y . y x))(\lambda x . x)\left(\lambda x_{x} x\right)$
$\rightarrow_{\beta}(\lambda y \cdot y(\lambda x . x))(\lambda x . x)$

## Example

$$
\lambda f .((\lambda x . f(x x))(\lambda x . f(x x)))
$$

## Possible Answer

$$
\begin{aligned}
&(\lambda f .((\lambda x . f(x x))(\lambda x . f(x x))))(\lambda z . z) \\
& \rightarrow \\
& \rightarrow_{\beta}(\lambda x .(\lambda z . z)(x x))(\lambda x .(\lambda z . z)(x x)) \\
& \rightarrow_{\beta}(\lambda z . z)(\lambda x .(\lambda z . z)(x x))(\lambda x .(\lambda z . z)(x x)) \\
& \rightarrow_{\beta}(\lambda x .(\lambda z . z)(x x))(\lambda x .(\lambda z . z)(x x)) \\
& \rightarrow_{\beta}(\lambda z . z)(\lambda x .(\lambda z . z)(x x))(\lambda x .(\lambda z . z)(x x)) \\
& \rightarrow_{\beta}(\lambda x .(\lambda z . z)(x x))(\lambda x .(\lambda z . z)(x x)) \\
& \rightarrow_{\beta} \cdots
\end{aligned}
$$

## Alternate Answer

$(\lambda f .((\lambda x . f(x x))(\lambda x . f(x x))))(\lambda z . z)$
$\rightarrow_{\beta}(\lambda x .(\lambda z . z)(x x))(\lambda x .(\lambda z . z)(x x))$
$\rightarrow_{\beta}(\lambda x . x x)(\lambda x .(\lambda z . z)(x x))$
$\rightarrow_{\beta}(\lambda x . x x)(\lambda x . x x)$
$\rightarrow_{\beta}(\lambda x . x x)(\lambda x . x x)$
$\rightarrow_{\beta} \ldots$

## Be Very Afraid!

- Some $\lambda$-calculus terms can be $\beta$-reduced forever!
- Just like some computer programs, which can evaluate forever
- The order in which you choose to do the reductions might change the result!
- Just like lazy evaluation vs. eager evaluation

## Liberal Arts Trivia: Biology

- These even-toed ungulate have one or two distinctive fatty deposits on their backs. They are native to the dry desert areas of Asia. They are domesticated to provide meat and milk, as well as to serve as beasts of burden. The US Army had an active cavalry corps based on these beasts in California in the $19^{\text {th }}$ century, and they have been used in wars throughout Africa.

Liberal Arts Trivia: Classics

- The Temple of Artemis at Ephesus, the Statue of Zeus at Olympus, and the Tomb of Maussollos are three of the Seven Wonders of the Ancient World. Name the other four.

## Liberal Arts Trivia: British Lit

- This 1883 coming-of-age tale of "pirates and buried gold" by Robert Louis Stevenson had a vast influence on the popular perception of pirates. Its legacies include treasure maps with an " $X$ ", the Black Spot, tropical islands, and one-legged seamen with parrots on their shoulders.
- Name the book.
- Name the morally gray, parrot-holding mutineer.

## Take on Faith (until Grad PL)

- All ways of choosing reductions that reduce a lambda expression to normal form will produce the same normal form (but some might never produce a normal form).
- If we always apply the outermost lambda first, we will find the normal form if there is one.
- This is normal order reduction - corresponds to normal order (lazy) evaluation

## Universal Language

- Is Lambda Calculus a universal language?
- Can we compute any computable algorithm using Lambda Calculus?
- To prove it is not:
- Find some Turing Machine that cannot be simulated with Lambda Calculus
- To prove it is:
- Show you can simulate every Turing Machine using Lambda Calculus

## Universal Language

- Is Lambda Calculus a universal language?
- Can we compute any computable algorithm using Lambda Calculus?
- To prove it is not:
- Find some Turing Machine that cannot be simulated with Lambda Calculus
- To prove it is:
- Show you can simulate every Turing Machine using Lambda Calculus

## Simulating Every Turing Machine

- A Universal Turing Machine can simulate every Turing Machine
- So, to show Lambda Calculus can simulate every Turing Machine, all we need to do is show it can simulate a Universal Turing Machine!

Simulating Computation that computation: output is the normal form

- How do we simulate the FSM?

## Simulating Computation

## In search of the truth?

- What does true mean?

- True is something that when used as the first operand of if, makes the value of the if the value of its second operand:
if $\mathrm{T} M N \rightarrow M$
?
Confirm

Press OK to continue, or Cancel to stay on the current page.

Don't search for $\mathbf{T}$, search for if

## $\mathbf{T} \equiv \lambda x(\lambda y, x)$

$\equiv \lambda x y . x$
$\mathbf{F} \equiv \lambda x(\lambda y \cdot y))$
$\mathbf{i f} \equiv \lambda p c a \cdot p c a$

## The Truth Is Out There

$$
\begin{aligned}
& \mathbf{T} \equiv \lambda x \cdot(\lambda y \cdot x) \\
& \mathbf{F} \equiv \lambda x \cdot(\lambda y \cdot y) \\
& \mathbf{i f} \equiv \lambda p \cdot(\lambda c \cdot(\lambda a \cdot p c a)))
\end{aligned}
$$

## if $\mathbf{T} \boldsymbol{M} \boldsymbol{N}$

$((\lambda p c a \cdot p c a)(\lambda x y . x)) M N$

$$
\begin{aligned}
& \mathbf{T} \equiv \lambda x \cdot(\lambda y \cdot x) \\
& \mathbf{F} \equiv \lambda x \cdot(\lambda y \cdot y) \\
& \text { if } \equiv\lambda p \cdot(\lambda c \cdot(\lambda a \cdot p c a))) \\
& \text { if } \mathbf{T} \boldsymbol{M} \boldsymbol{N} \\
& \quad((\lambda p c a \cdot p c a)(\lambda x y \cdot x)) \boldsymbol{M} \boldsymbol{N} \\
&\left.\rightarrow_{\beta}(\lambda c a \cdot(\lambda x \cdot(\lambda y \cdot x)) c a)\right) \boldsymbol{M} \boldsymbol{N} \\
& \rightarrow_{\beta} \rightarrow_{\beta}(\lambda x \cdot(\lambda y \cdot x)) \boldsymbol{M} \boldsymbol{N} \\
&\left.\rightarrow_{\beta}(\lambda y \cdot \boldsymbol{M})\right) \boldsymbol{N} \rightarrow_{\beta} \boldsymbol{M}
\end{aligned}
$$

## Finding the Truth

Lambda Calculus is a Universal Computer?

- Read/Write Infinite Tape

Mutable Lists

- Finite State Machine

Numbers

- Processing

Way to make decisions (if)
Way to keep going

## and and or?

and $\equiv$
$\lambda x(\lambda y$. if $x y \mathbf{F}))$
or $\equiv$
$\lambda x(\lambda y$. if $x \mathbf{T} y))$

## Homework
