

# EECS 598-008 & EECS 498-008: Intelligent Programming Systems

## Lecture 8

# Announcements

---

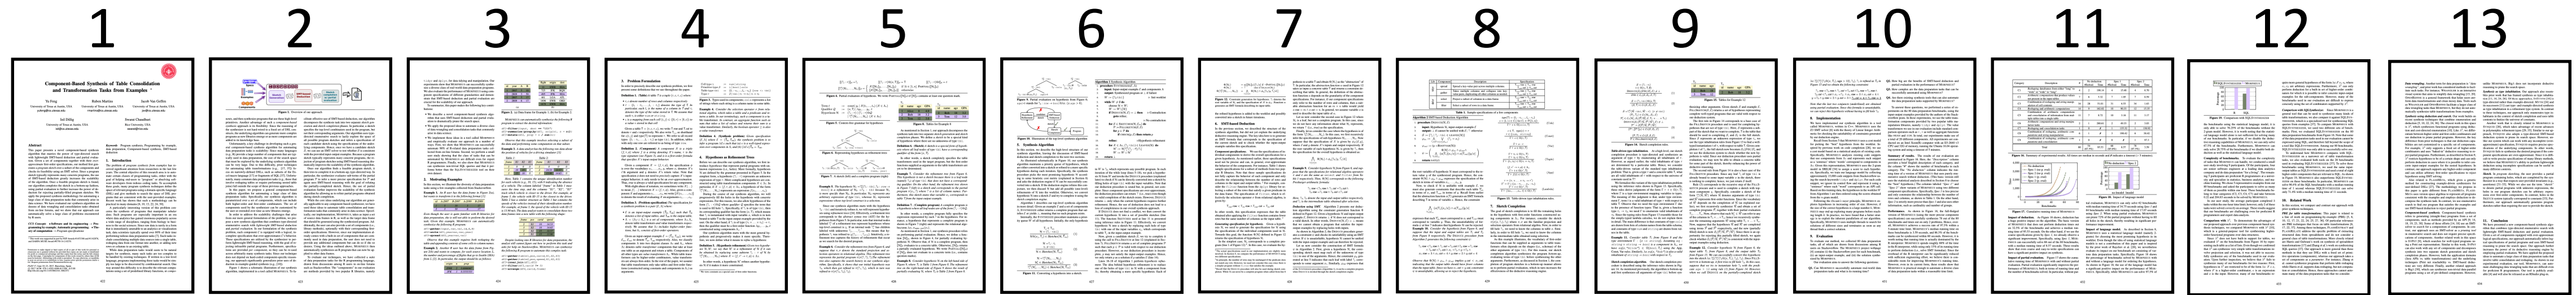

- **Live**, remote discussion 3-4pm Friday (tomorrow)
  - Zoom link on course website
  - Discuss A2 (due next Monday)
- CFPP due **midnight Tuesday, September 28**
  - Submit your paper presentation preferences
  - Assignment will be released on Wednesday, after which you can start prep
- Course survey: <https://forms.gle/XVQ3uMPwNomP1onn7>
- More papers added to HotCRP

# Today's Agenda

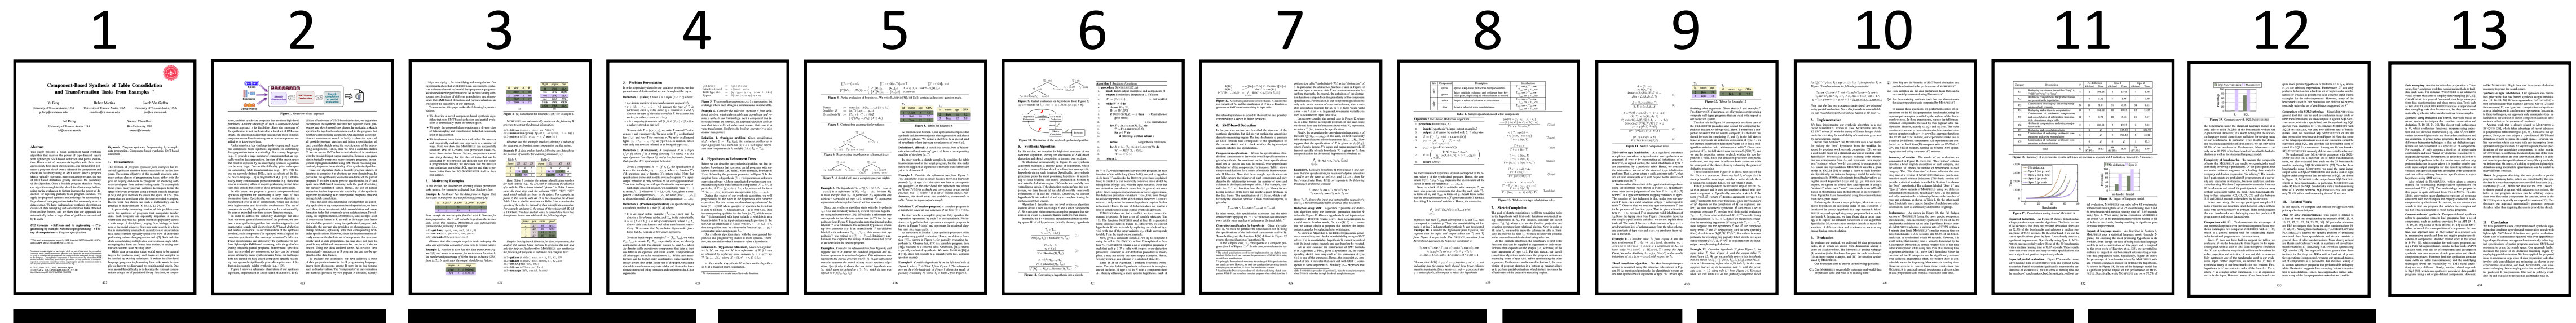

---

- Present Morpheus paper
  - Talk about Morpheus
  - Talk about how to present a (PL) research paper in general

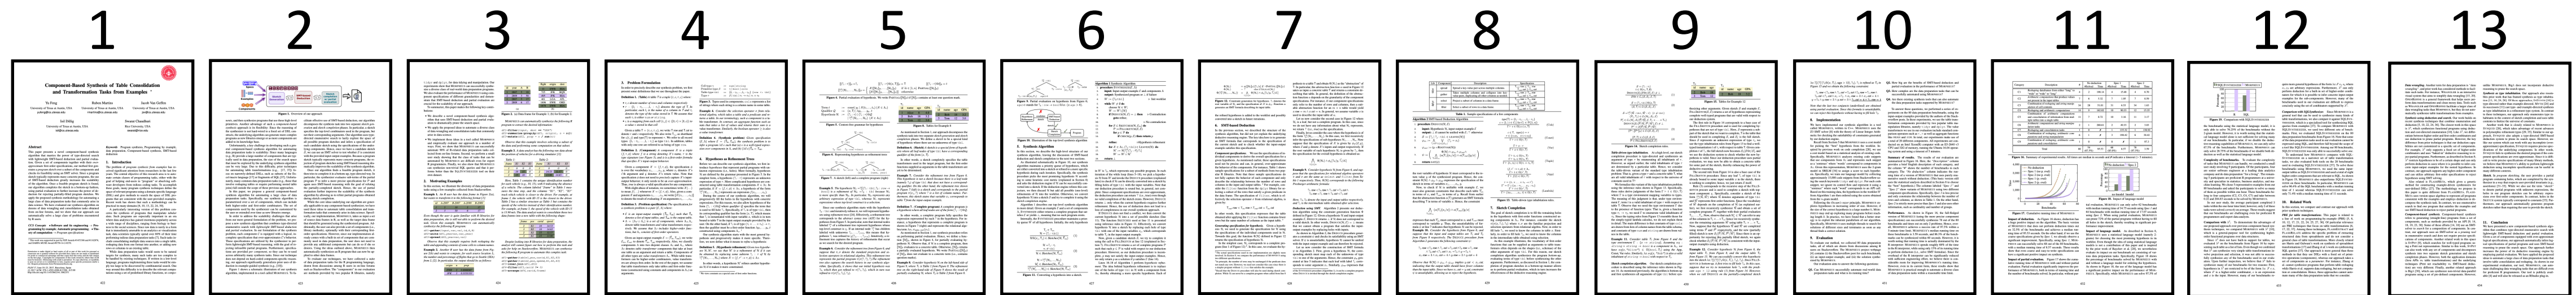

# What Does A (PL) Research Paper Look Like?

# What Does A (PL) Research Paper Look Like?

# What Does A (PL) Research Paper Look Like?

**Introduction: problem, idea, solution, evaluation, at high-level, 2 pages**

# How To Present A Research Paper?

---

- **What's the problem? Why is it important?**
- Why is the problem challenging?
- How does the paper solve the problem? What's the key idea?
- Explain technique in more detail
- Evaluation
- Related work

# Explain the Problem at a High-Level

---

- Data preparation
  - Data prep is tedious involving consolidating data sources, cleaning, reshaping, etc.
  - Especially important in the “big data” era

## **Component-Based Synthesis of Table Consolidation and Transformation Tasks from Examples \***

Yu Feng

University of Texas at Austin, USA

# Explain the Problem at a High-Level

---

- Data preparation
  - Data prep is tedious involving consolidating data sources, cleaning, reshaping, etc.
  - Especially important in the “big data” era
- How to automatically synthesize table transformation programs?
  - Given a library of functions for table transformation and a set of input-output examples, how to find a program?

# Explain the Problem at a High-Level

---

- Data preparation
  - Data prep is tedious involving consolidating data sources, cleaning, reshaping, etc.
  - Especially important in the “big data” era
- How to automatically synthesize table transformation programs?
  - Given a library of functions for table transformation and a set of input-output examples, how to find a program?
- Useful because with this technique, non-experts can also “write” programs

# Use An Example to Illustrate the Problem

## Complex data reshaping in R

Asked 5 years, 3 months ago Active 1 year, 6 months ago Viewed 386 times

I have a data frame with 3 columns (extract below):

6

```
df <- data.frame(
  id = c(1,1,1,2,2,2),
  Year = c(2007, 2008, 2009, 2007, 2008, 2009),
  A = c(5, 2, 3, 7, 5, 6),
  B = c(10, 0, 50, 13, 17, 17)
)
df
```

I'd like to have this:

```
df_needed <- data.frame(
  id= c(1, 2),
  A_2007 = c(5, 7),
  B_2007 = c(10, 13),
  A_2008 = c(2, 5),
  B_2008 = c(0, 17),
  A_2009 = c(3, 6),
  B_2009 = c(50, 17)
)
df_needed
```

I'm familiar with `reshape` and `tidyR` but I don't think they can manage this transformation.

**Is there a proper way to do that or I need to do it with a custom function ?**

# Use An Example to Illustrate the Problem

## Complex data reshaping in R

Asked 5 years, 3 months ago Active 1 year, 6 months ago Viewed 386 times

I have a data frame with 3 columns (extract below):

```
df <- data.frame(
  id = c(1,1,1,2,2,2),
  Year = c(2007, 2008, 2009, 2007, 2008, 2009),
  A = c(5, 2, 3, 7, 5, 6),
  B = c(10, 0, 50, 13, 17, 17)
)
df
```

I'd like to have this:

```
df_needed <- data.frame(
  id= c(1, 2),
  A_2007 = c(5, 7),
  B_2007 = c(10, 13),
  A_2008 = c(2, 5),
  B_2008 = c(0, 17),
  A_2009 = c(3, 6),
  B_2009 = c(50, 17)
)
df_needed
```

I'm familiar with `reshape` and `tidyR` but I don't think they can manage this transformation.

Is there a proper way to do that or I need to do it with a custom function ?

| id | year | A | B  |
|----|------|---|----|
| 1  | 2007 | 5 | 10 |
| 2  | 2009 | 3 | 50 |
| 1  | 2007 | 5 | 17 |
| 2  | 2009 | 6 | 17 |

Input Example

```
df1=gather(input, var, val, id, A, B)
df2=unite(df1, yearvar, var, year)
df3=spread(df2, yearvar, val)
```

Output Example

| id | A_2007 | B_2007 | A_2009 | B_2009 |
|----|--------|--------|--------|--------|
| 1  | 5      | 10     | 5      | 17     |
| 2  | 3      | 50     | 6      | 17     |

# Use More Examples to Illustrate the Problem

| flight | origin | dest |
|--------|--------|------|
| 11     | EWR    | SEA  |
| 725    | JFK    | BQN  |
| 495    | JFK    | SEA  |
| 461    | LGA    | ATL  |
| 1696   | EWR    | ORD  |
| 1670   | EWR    | SEA  |

Input Example

“find out proportions of flights to destination(Seattle)”

```
df1=filter(input, dest == "SEA")  
df2=summarize(group_by(df1, origin), n = n())  
df3=mutate(df2, prop = n / sum(n))
```

| <i>origin</i> | <i>n</i> | <i>prop</i>      |
|---------------|----------|------------------|
| <i>EWR</i>    | <i>2</i> | <i>0.6666667</i> |
| <i>JFK</i>    | <i>1</i> | <i>0.3333333</i> |

Output Example

# Use More Examples to Illustrate the Problem

“I want to combine these 2 data frames to create a new one which looks like this”

| <i>Table 1:</i> |           |           |           | <i>Table 2:</i> |           |           |           |
|-----------------|-----------|-----------|-----------|-----------------|-----------|-----------|-----------|
| <i>frame</i>    | <i>X1</i> | <i>X2</i> | <i>X3</i> | <i>frame</i>    | <i>X1</i> | <i>X2</i> | <i>X3</i> |
| 1               | 0         | 0         | 0         | 1               | 0         | 0         | 0         |
| 2               | 10        | 15        | 0         | 2               | 14.53     | 12.57     | 0         |
| 3               | 15        | 10        | 0         | 3               | 13.90     | 14.65     | 0         |

Input Example

| <i>frame</i> | <i>pos</i> | <i>carid</i> | <i>speed</i> |
|--------------|------------|--------------|--------------|
| 2            | X1         | 10           | 14.53        |
| 3            | X2         | 10           | 14.65        |
| 2            | X2         | 15           | 12.57        |
| 3            | X1         | 15           | 13.90        |

Output Example

```
df1=gather(table1,pos,carid,X1,X2,X3)
df2=gather(table2,pos,speed,X1,X2,X3)
df3=inner_join(df1,df2)
df4=filter(df3,carid != 0)
df5=arrange(df4,carid,frame)
```

# How To Present A Research Paper?

---

- What's the problem? Why is it important?
- **Why is the problem challenging?**
- How does the paper solve the problem? What's the key idea?
- Explain technique in more detail
- Evaluation
- Related work

# What are the Challenges?

---

- Problem: given a library of functions and a set of examples, find a program using functions in the library that satisfies the provided examples.

# What are the Challenges?

---

- Problem: given a library of functions and a set of examples, find a program using functions in the library that satisfies the provided examples.
- **Key challenge: scalability**
  - Large number of functions in library (e.g., R)
  - Previous approaches consider very small languages

# How To Present A Research Paper?

---

- What's the problem? Why is it important?
- Why is the problem challenging?
- **How does the paper solve the problem? What's the key idea?**
- Explain technique in more detail
- Evaluation
- Related work

# Key idea

---

- Lightweight SMT-based deduction for pruning

# How To Present A Research Paper?

- How does the paper solve the problem? What's the key idea?
- **Explain technique in more detail**
- Evaluation
- Related work

# Problem Formulation

---

- Given an input-output example  $E$  and a library of components  $\Lambda$ , find a program  $\lambda \vec{x} . e$  over  $\Lambda$  such that (1)  $e$  is well-typed over  $\Lambda$  and (2)  $(\lambda \vec{x} . e)E_{in} = E_{out}$

# Problem Formulation

---

- Given an input-output example  $E$  and a library of components  $\Lambda$ , find a program  $\lambda \vec{x} . e$  over  $\Lambda$  such that (1)  $e$  is well-typed over  $\Lambda$  and (2)  $(\lambda \vec{x} . e)E_{in} = E_{out}$
- Also known as “component-based program synthesis”
  - A program is a loop-free composition of components from a given library

# Problem Formulation

---

- Given an input-output example  $E$  and a library of components  $\Lambda$ , find a program  $\lambda \vec{x} . e$  over  $\Lambda$  such that (1)  $e$  is well-typed over  $\Lambda$  and (2)  $(\lambda \vec{x} . e)E_{in} = E_{out}$
- Also known as “component-based program synthesis”
  - A program is a loop-free composition of components from a given library
  - Component-based vs. DSL-based
    - Any type-safe composition is okay vs. syntactic restrictions imposed by grammar

# Important Concepts

---

- Hypothesis: “partial program”

|                          |      |  |
|--------------------------|------|--|
| Term $t$                 | $:=$ | $\text{const} \mid y_i \mid \mathcal{X}(t_1, \dots, t_n) \ (\mathcal{X} \in \Lambda_v)$  |
| Qualifier $Q$            | $:=$ | $(x, \top) \mid \lambda y_1, \dots, y_n. t$  |
| Hypothesis $\mathcal{H}$ | $:=$ | $(?_i : \tau) \mid (?_i : \tau)@Q$<br>$\mid ?_i^{\mathcal{X}}(\mathcal{H}_1, \dots, \mathcal{H}_n) \ (\mathcal{X} \in \Lambda_{\top})$ |

---

**Figure 5.** Context-free grammar for hypotheses

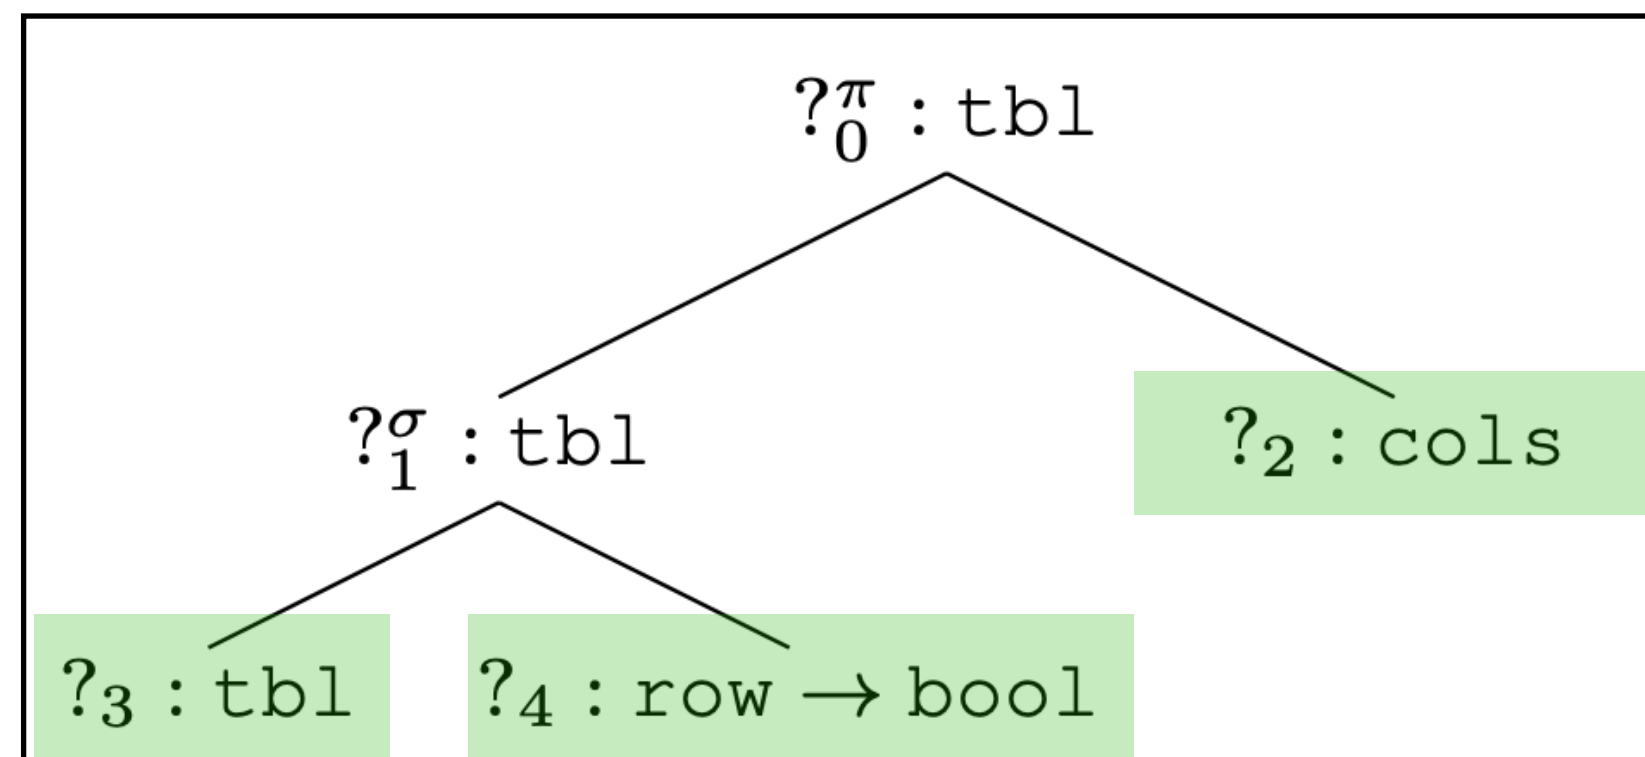

# Important Concepts

- Hypothesis: “partial program”

|                          |      |  |
|--------------------------|------|--|
| Term $t$                 | $:=$ | $\text{const} \mid y_i \mid \mathcal{X}(t_1, \dots, t_n) \ (\mathcal{X} \in \Lambda_v)$  |
| Qualifier $Q$            | $:=$ | $(x, \mathbb{T}) \mid \lambda y_1, \dots, y_n. t$  |
| Hypothesis $\mathcal{H}$ | $:=$ | $(?_i : \tau) \mid (?_i : \tau)@Q$<br>$\mid ?_i^{\mathcal{X}}(\mathcal{H}_1, \dots, \mathcal{H}_n) \ (\mathcal{X} \in \Lambda_{\mathbb{T}})$ |

**Figure 5.** Context-free grammar for hypotheses

Leaf node is hole (base case)

# Important Concepts

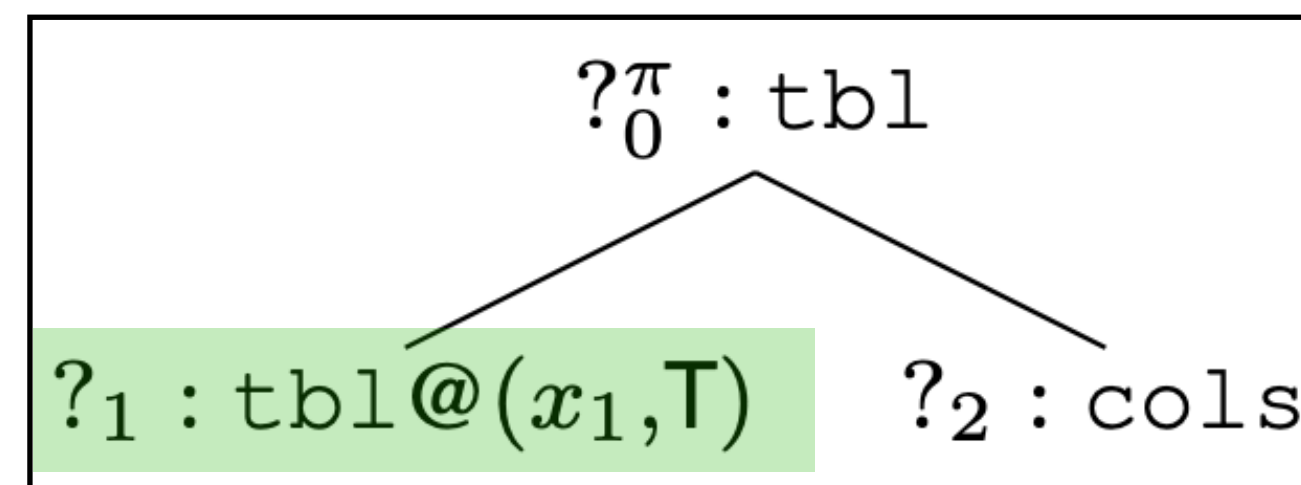

- Hypothesis: “partial program”

|                          |      |   |
|--------------------------|------|---|
| Term $t$                 | $:=$ | $\text{const} \mid y_i \mid \mathcal{X}(t_1, \dots, t_n) \ (\mathcal{X} \in \Lambda_v)$   |
| Qualifier $Q$            | $:=$ | $(x, T) \mid \lambda y_1, \dots, y_n. t$  |
| Hypothesis $\mathcal{H}$ | $:=$ | $(?_i : \tau) \mid (?_i : \tau)@Q$<br>$\mid ?_i^{\mathcal{X}}(\mathcal{H}_1, \dots, \mathcal{H}_n) \ (\mathcal{X} \in \Lambda_T)$ |

**Figure 5.** Context-free grammar for hypotheses

Leaf node is hole with qualifier (base case)

A qualifier expresses additional information about the hole, i.e., how to fill the hole

$?_1$  must be replaced with variable  $x_1$  which binds to table  $T$ , i.e., this leaf node is concrete

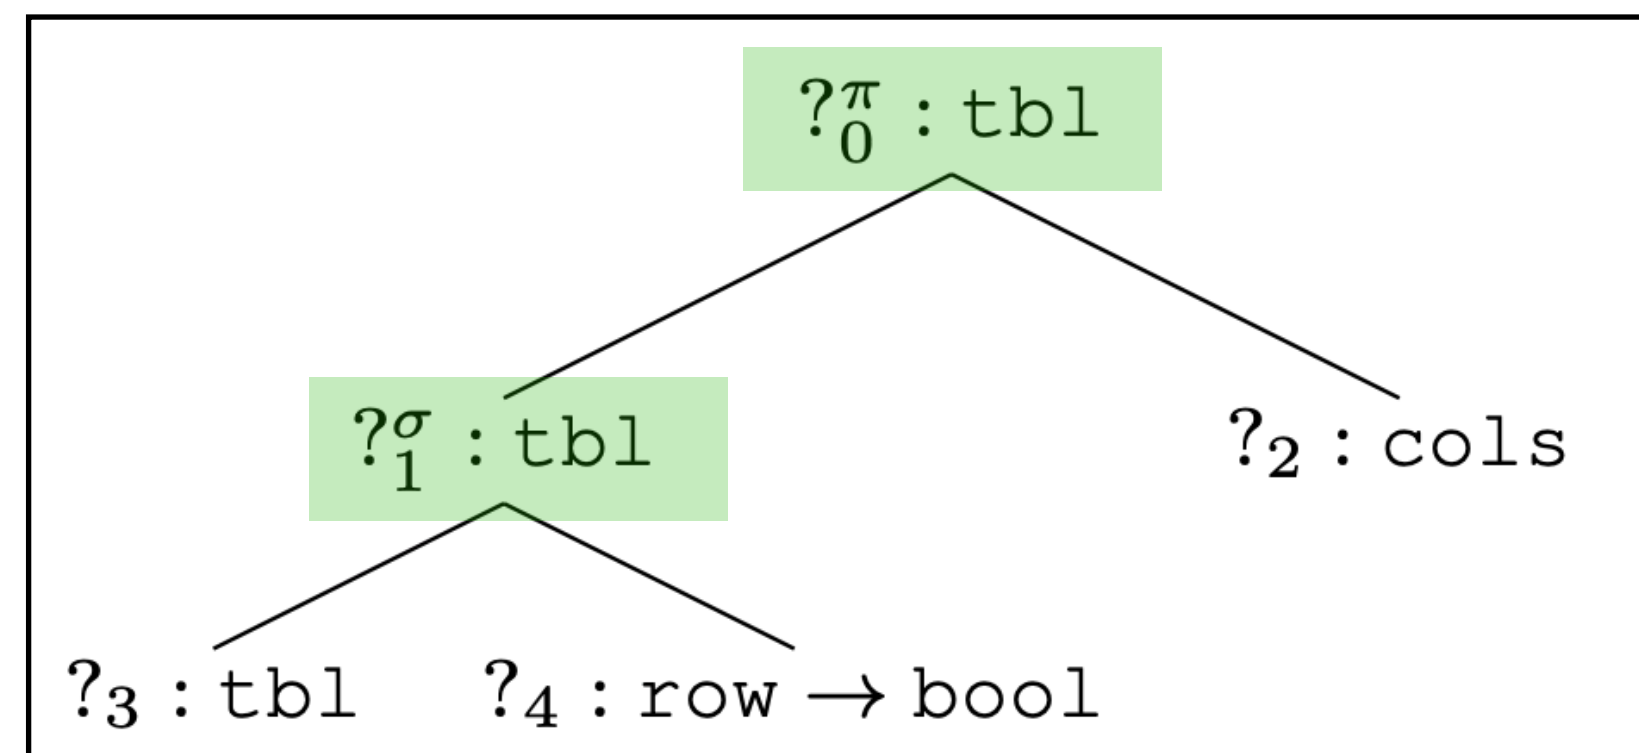

# Important Concepts

- Hypothesis: “partial program”

Term  $t$  :=  $\text{const} \mid y_i \mid \mathcal{X}(t_1, \dots, t_n) \ (\mathcal{X} \in \Lambda_v)$   
Qualifier  $Q$  :=  $(x, \mathbb{T}) \mid \lambda y_1, \dots, y_n. t$   
Hypothesis  $\mathcal{H}$  :=  $(?_i : \tau) \mid (?_i : \tau)@Q$   
|  $?_i^{\mathcal{X}}(\mathcal{H}_1, \dots, \mathcal{H}_n) \ (\mathcal{X} \in \Lambda_{\mathbb{T}})$

**Figure 5.** Context-free grammar for hypotheses

Non-leaf node (recursive case)

# Important Concepts

- Hypothesis: “partial program”

|                          |      |   |
|--------------------------|------|---|
| Term $t$                 | $:=$ | $\text{const} \mid y_i \mid \mathcal{X}(t_1, \dots, t_n) \ (\mathcal{X} \in \Lambda_v)$   |
| Qualifier $Q$            | $:=$ | $(x, \top) \mid \lambda y_1, \dots, y_n. t$   |
| Hypothesis $\mathcal{H}$ | $:=$ | $(?_i : \tau) \mid (?_i : \tau) @ Q$<br>$\mid ?_i^{\mathcal{X}}(\mathcal{H}_1, \dots, \mathcal{H}_n) \ (\mathcal{X} \in \Lambda_T)$ |

**Figure 5.** Context-free grammar for hypotheses

Table transformers

Functions that transform tables to tables

```
df1=filter(input, dest == "SEA")  
df2=summarize(group_by(df1, origin), n = n())  
df3=mutate(df2, prop = n / sum(n))
```

# Important Concepts

- Hypothesis: “partial program”

|                          |      |   |                               |
|--------------------------|------|---|-------------------------------|
| Term $t$                 | $:=$ | $\text{const} \mid y_i \mid \mathcal{X}(t_1, \dots, t_n)$   | $(\mathcal{X} \in \Lambda_v)$ |
| Qualifier $Q$            | $:=$ | $(x, \top) \mid \lambda y_1, \dots, y_n. t$   |                               |
| Hypothesis $\mathcal{H}$ | $:=$ | $(?_i : \tau) \mid (?_i : \tau)@Q$<br>$\mid ?_i^{\mathcal{X}}(\mathcal{H}_1, \dots, \mathcal{H}_n)$ | $(\mathcal{X} \in \Lambda_T)$ |

**Figure 5.** Context-free grammar for hypotheses

## Value transformers

Functions that don't transform tables; they transform values.  
Constants are special value transformers.

```
df1=filter(input, dest == "SEA")  
df2=summarize(group_by(df1, origin), n = n())  
df3=mutate(df2, prop = n / sum(n))
```

# Important Concepts

---

- Sketch: a special form of hypothesis, where all table-typed leaf nodes are concrete

# Important Concepts

---

- Sketch: a special form of hypothesis, where all table-typed leaf nodes are concrete

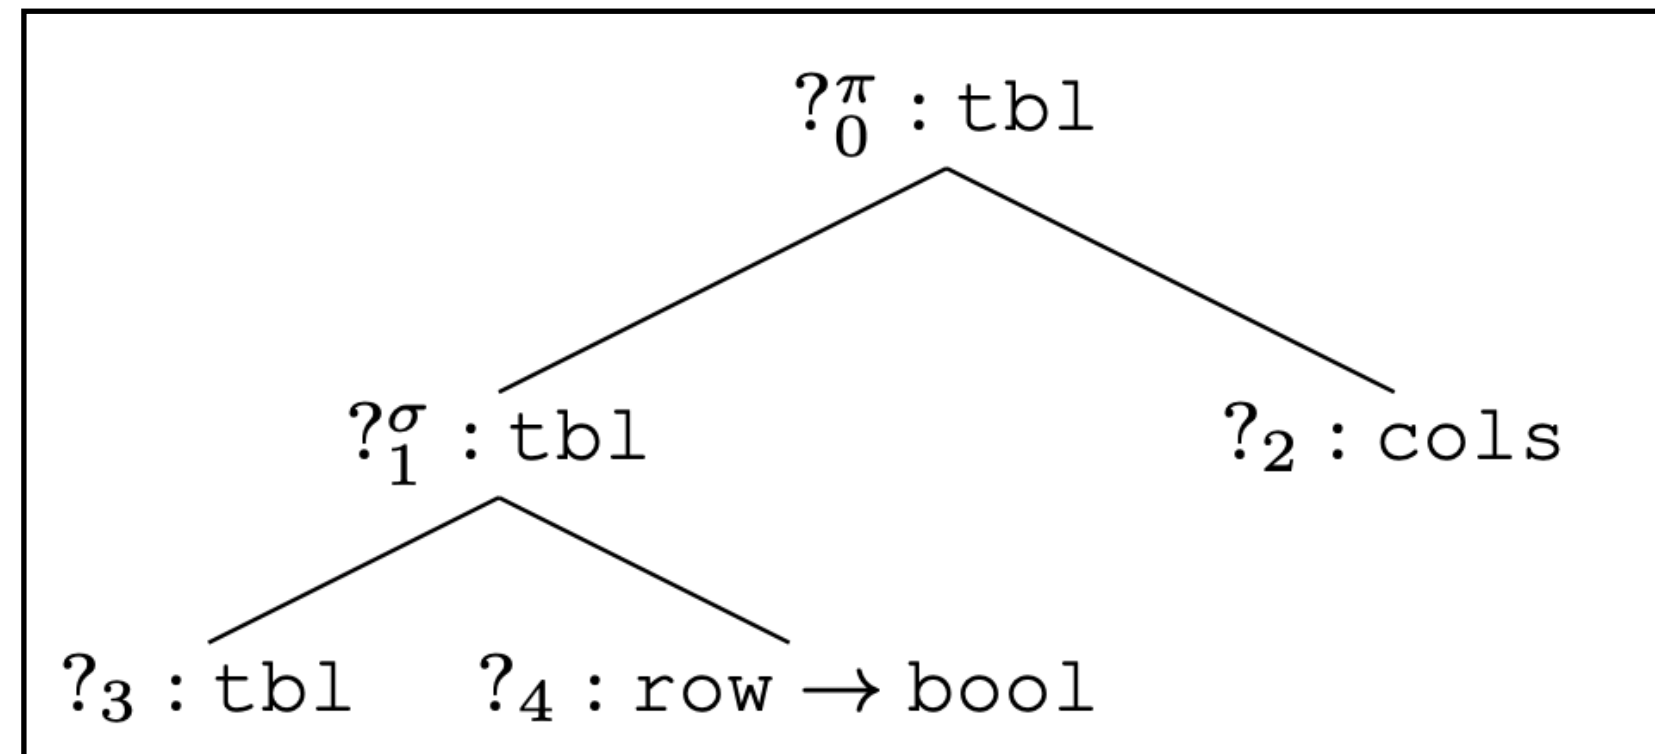

Hypothesis, not sketch

Hypothesis, and sketch

# Important Concepts

- Sketch: a special form of hypothesis, where all table-typed leaf nodes are concrete
- Essentially, in sketch, all table-typed holes are concrete
- In other words, sketch represents a “smaller space” of concrete programs

Hypothesis, not sketch

Hypothesis, and sketch

# Synthesis Algorithm

# Use N-gram Models for Search Prioritization

---

- Not a major contribution of this paper: application of standard technique
- Implementation section

Recall from Section 5 that MORPHEUS uses a cost model for picking the “best” hypothesis from the worklist. Inspired by previous work on code completion [28], we use a cost model based on a statistical analysis of existing code. Specifically, MORPHEUS analyzes existing code snippets that use components from  $\Lambda_T$  and represents each snippet as a ‘sentence’ where ‘words’ correspond to components in  $\Lambda_T$ . Given this representation, MORPHEUS uses the 2-gram model in SRILM [34] to assign a score to each hypothesis. Specifically, we train our language model by collecting approximately 15,000 code snippets from Stackoverflow using the search keywords `tidyr` and `dplyr`. For each code snippet, we ignore its control flow and represent it using a “sentence” where each “word” corresponds to an API call. Based on this training data, the hypotheses in the worklist  $W$  from Algorithm 1 are then ordered using the scores obtained from the  $n$ -gram model.

# Morpheus vs. $\lambda^2$

---

- $\lambda^2$  solves 0 out of 80 benchmarks
  - Because  $\lambda^2$  uses a DSL that's not tailored towards table transformations in R
  - **Take-away: having the right DSL (abstraction) is very important for synthesis!**
